Configuration

Please use adafruit_crickit_m0 ID for board option in “platformio.ini” (Project Configuration File):

```ini
[env:adafruit_crickit_m0]
platform = atmelsam
board = adafruit_crickit_m0
```

You can override default Adafruit Crickit M0 settings per build environment using board_*** option, where *** is a JSON object path from board manifest adafruit_crickit_m0.json. For example, board_build.mcu, board_build.f_cpu, etc.

```ini
[env:adafruit_crickit_m0]
platform = atmelsam
board = adafruit_crickit_m0
```

(continues on next page)
; change microcontroller
board_build.mcu = samd21g18a

; change MCU frequency
board_build.f_cpu = 48000000L

**Uploading**

Adafruit Crickit M0 supports the next uploading protocols:

- atmel-ice
- blackmagic
- jlink
- sam-ba

Default protocol is sam-ba

You can change upload protocol using `upload_protocol` option:

```
[env:adafruit_crickit_m0]
platform = atmelsam
board = adafruit_crickit_m0
upload_protocol = sam-ba
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in "platformio.ini" (Project Configuration File).

Adafruit Crickit M0 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use adafruit_itsybitsy_m4 ID for board option in “platformio.ini” (Project Configuration File):

```
[env:adafruit_itsybitsy_m4]
platform = atmelsam
board = adafruit_itsybitsy_m4
```

You can override default Adafruit ItsyBitsy M4 settings per build environment using board_*** option, where *** is a JSON object path from board manifest adafruit_itsybitsy_m4.json. For example, board_build.mcu, board_build.ffd_cpu, etc.

```
[env:adafruit_itsybitsy_m4]
platform = atmelsam
board = adafruit_itsybitsy_m4
```

(continues on next page)
; change microcontroller
board_build.mcu = samd51g19a

; change MCU frequency
board_build.f_cpu = 120000000L

---

**Uploading**

Adafruit ItsyBitsy M4 supports the next uploading protocols:

- atmel-ice
- jlink
- sam-ba

Default protocol is sam-ba

You can change upload protocol using `upload_protocol` option:

```ini
[env:adafruit_itsybitsy_m4]
platform = atmelsam
board = adafruit_itsybitsy_m4
upload_protocol = sam-ba
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

This chapter is about the debugging process and includes the following sections:

### Warning:
You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Adafruit ItsyBitsy M4 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</tbody>
</table>

Configuration

Please use `adafruit_pyportal_m4_titano` ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:adafruit_pyportal_m4_titano]
platform = atmelsam
board = adafruit_pyportal_m4_titano
```

You can override default Adafruit PyPortal M4 Titano settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `adafruit_pyportal_m4_titano.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:adafruit_pyportal_m4_titano]
platform = atmelsam
board = adafruit_pyportal_m4_titano
```

(continues on next page)
Uploading

Adafruit PyPortal M4 Titano supports the next uploading protocols:

- atmel-ice
- jlink
- sam-ba

Default protocol is sam-ba

You can change upload protocol using `upload_protocol` option:

```ini
[env:adafruit_pyportal_m4_titano]
platform = atmelsam
board = adafruit_pyportal_m4_titano
upload_protocol = sam-ba
```

Debugging

`Debugging` - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

Adafruit PyPortal M4 Titano does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

board = mzeroUSB
```

You can override default Arduino M0 settings per build environment using board_*** option, where *** is a JSON object path from board manifest mzeroUSB.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:mzeroUSB]
platform = atmelsam
board = mzeroUSB
```

(continues on next page)
Uploading

Arduino M0 supports the next uploading protocols:

- atmel-ice
- blackmagic
- jlink
- stk500v2

Default protocol is stk500v2

You can change upload protocol using upload_protocol option:

```ini
[env:mzeroUSB]
platform = atmel-sam
board = mzeroUSB
upload_protocol = stk500v2
```

Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in "platformio.ini" (Project Configuration File).

Arduino M0 does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

</tr>
<tr>
<td>Flash</td>
<td>256KB</td>
</tr>
<tr>
<td>RAM</td>
<td>32KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Arduino</td>
</tr>
</tbody>
</table>

Configuration

Please use mkrzero ID for board option in “platformio.ini” (Project Configuration File):

```
[env:mkrzero]
platform = atmel_sam
board = mkrzero
```

You can override default Arduino MKRZERO settings per build environment using board_*** option, where *** is a JSON object path from board manifest mkrzero.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:mkrzero]
platform = atmel_sam
board = mkrzero
```

(continues on next page)
Uploaded Arduino MKRZERO supports the next uploading protocols:

- `atmel-ice`
- `blackmagic`
- `jlink`
- `sam-ba`

Default protocol is `sam-ba`

You can change upload protocol using `upload_protocol` option:

```
[env:mkrzero]
platform = atmelsam
board = mkrzero
upload_protocol = sam-ba
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

*Warning:* You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” *(Project Configuration File)*.

Arduino MKRZERO does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use `briki_abc_samd21` ID for `board` option in “platformio.ini” (Project Configuration File):

```
[env:briki_abc_samd21]
platform = atmel
board = briki_abc_samd21
```

You can override default Briki ABC (MBC-WB) - Samd21 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `briki_abc_samd21.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:briki_abc_samd21]
platform = atmel
board = briki_abc_samd21
```

(continues on next page)
; change microcontroller
board_build.mcu = samd21g18a

; change MCU frequency
board_build.f_cpu = 48000000L

### Uploading

Briki ABC (MBC-WB) - Samd21 supports the next uploading protocols:

- atmel-ice
- blackmagic
- jlink
- mbctool
- sam-ba
- stk500v2

Default protocol is mbctool

You can change upload protocol using `upload_protocol` option:

```
[env:briki_abc_samd21]
platform = atmelsam
board = briki_abc_samd21
upload_protocol = mbctool
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in `platformio.ini` (Project Configuration File).

Briki ABC (MBC-WB) - Samd21 does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use `sodaq_one` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:sodaq_one]
platform = atmel
board = sodaq
```

You can override default SODAQ ONE settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `sodaq_one.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:sodaq_one]
platform = atmel
board = sodaq_one
```

(continues on next page)
; change microcontroller
board_build.mcu = samd21g18a

; change MCU frequency
board_build.f_cpu = 48000000L

### Uploading

SODAQ ONE supports the next uploading protocols:

- atmel-ice
- blackmagic
- jlink
- sam-ba

Default protocol is sam-ba

You can change upload protocol using `upload_protocol` option:

```ini
[env:sodaq_one]
platform = atmelsam
board = sodaq_one
upload_protocol = sam-ba
```

#### Hardware

Platform **Atmel SAM**: Atmel | SMART offers Flash-based ARM products based on the ARM Cortex-M0+, Cortex-M3 and Cortex-M4 architectures, ranging from 8KB to 2MB of Flash including a rich peripheral and feature mix.

<table>
<thead>
<tr>
<th>Microcontroller</th>
<th>SAMD21G18A</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>48MHz</td>
</tr>
<tr>
<td>Flash</td>
<td>256KB</td>
</tr>
<tr>
<td>RAM</td>
<td>32KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Seeed</td>
</tr>
</tbody>
</table>

#### Configuration

Please use `seeed_xiao` ID for `board` option in “`platformio.ini`” *(Project Configuration File)*:

```ini
[env:seeed_xiao]
platform = atmelSAM
board = seeed_xiao
```
You can override default Seeeduino XIAO settings per build environment using `board_{***}` option, where `{***}` is a JSON object path from board manifest `seeed_xiao.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:seeed_xiao]
platform = atmelsam
board = seeed_xiao

; change microcontroller
board_build.mcu = samd21g18a

; change MCU frequency
board_build.f_cpu = 48000000L
```

### Uploading

Seeeduino XIAO supports the next uploading protocols:

- `atmel-ice`
- `blackmagic`
- `jlink`
- `sam-ba`

Default protocol is `sam-ba`

You can change upload protocol using `upload_protocol` option:

```ini
[env:seeed_xiao]
platform = atmelsam
board = seeed_xiao

upload_protocol = sam-ba
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

Seeeduino XIAO does not have on-board debug probe and is **NOT READY** for debugging. You will need to use/buy one of external probe listed below.

<table>

You can override default Tuino 096 settings per build environment using board_*** option, where *** is a JSON object path from board manifest tuinozero96.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:tuinozero96]
platform = atmelsam
board = tuinozero96

; change microcontroller
board_build.mcu = samd21g18a

; change MCU frequency
board_build.f_cpu = 48000000L
```

Uploading

Tuino 096 supports the next uploading protocols:
- atmel-ice
- blackmagic
- jlink
- stk500v2

Default protocol is stk500v2

You can change upload protocol using `upload_protocol` option:

```
[env:tuinozero96]
platform = atmel.sam
board = tuinozero96
upload_protocol = stk500v2
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Tuino 096 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</table>
Configuration

Please use `espea32` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:espea32]
platform = espressif32
board = espea32
```

You can override default April Brother ESPea32 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `espea32.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:espea32]
platform = espressif32
board = espea32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

April Brother ESPea32 supports the next uploading protocols:

- espota
- esptool

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```ini
[env:espea32]
platform = espressif32
board = espea32

upload_protocol = esptool
```

Debugging

`Debugging` currently does not support April Brother ESPea32 board.

#### Hardware

Platform *Espressif 32*: Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.
Microcontroller | ESP32  
--- | ---  
Frequency | 240MHz  
Flash | 3.25MB  
RAM | 320KB  
Vendor | meteca  

## Configuration

Please use briki_abc_esp32 ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:briki_abc_esp32]
platform = espressif32
board = briki_abc_esp32
```

You can override default Briki ABC (MBC-WB) - ESP32 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest briki_abc_esp32.json. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:briki_abc_esp32]
platform = espressif32
board = briki_abc_esp32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

## Uploading

Briki ABC (MBC-WB) - ESP32 supports the next uploading protocols:

- esp-prog
- iot-bus-jtag
- jlink
- mbctool
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
- tumpa

Default protocol is mbctool

You can change upload protocol using `upload_protocol` option:
[env:briki_abc.esp32]
platform = espressif32
board = briki_abc.esp32
upload_protocol = mbctool

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

</tr>
<tr>
<td>Flash</td>
<td>3.25MB</td>
</tr>
<tr>
<td>RAM</td>
<td>320KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>meteca</td>
</tr>
</tbody>
</table>

Configuration

Please use `briki_mbc-wb_esp32` ID for `board` option in “`platformio.ini` (Project Configuration File):

```
[env:briki_mbc-wb_esp32]
platform = espressif32
board = briki_mbc-wb_esp32
```

You can override default Briki MBC-WB - ESP32 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `briki_mbc-wb_esp32.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:briki_mbc-wb_esp32]
platform = espressif32
board = briki_mbc-wb_esp32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

Briki MBC-WB - ESP32 supports the next uploading protocols:

- esp-prog
- iot-bus-jtag
- jlink
- mbc
- mbctool
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
• olimex-arm-usb-tiny-h
• olimex-jtag-tiny
• tumpa

Default protocol is mbctool

You can change upload protocol using `upload_protocol` option:

```
[env:briki_mbc-wb_esp32]
platform = espressif32
board = briki_mbc-wb_esp32
upload_protocol = mbctool
```

### Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (**Project Configuration File**).

Briki MBC-WB - ESP32 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

<table>

Configuration

Please use `d-duino-32` ID for `board` option in “`platformio.ini`” (*Project Configuration File)*:

```
[env:d-duino-32]
platform = espressif32
board = d-duino-32
```

You can override default D-duino-32 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `d-duino-32.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:d-duino-32]
platform = espressif32
board = d-duino-32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

D-duino-32 supports the next uploading protocols:

- esp-prog
- espota
• esptool
• iot-bus-jtag
• jlink
• minimodule
• olimex-arm-usb-ocd
• olimex-arm-usb-ocd-h
• olimex-arm-usb-tiny-h
• olimex-jtag-tiny
• tumpa

Default protocol is esptool

You can change upload protocol using `upload_protocol` option:

```ini
[env:d-duino-32]
platform = espressif32
board = d-duino-32
upload_protocol = esptool
```

**Debugging**

</tbody>
</table>
Configuration

Please use espectro32 ID for board option in "platformio.ini" (Project Configuration File):

```
[env:espectro32]
platform = espressif32
board = espectro32
```

You can override default ESPectro32 settings per build environment using board_*** option, where *** is a JSON object path from board manifest espectro32.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:espectro32]
platform = espressif32
board = espectro32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

ESPectro32 supports the next uploading protocols:

- esp-prog
- espota
- esptool
- iot-bus-jtag
- jlink
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
- tumpa

Default protocol is esptool

You can change upload protocol using upload_protocol option:

```
[env:espectro32]
platform = espressif32
board = espectro32

upload_protocol = esptool
```
Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

ESPectro32 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

board = heltec_wifi_lora_32
```

You can override default Heltec WiFi LoRa 32 settings per build environment using *board_**** option, where *** is a JSON object path from board manifest *heltec_wifi_lora_32.json*. For example, *board_build.mcu*, *board_build.f_cpu*, etc.

```ini
[env:heltec_wifi_lora_32]
platform = espressif32
board = heltec_wifi_lora_32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

Heltec WiFi LoRa 32 supports the next uploading protocols:
- esp-prog
- espota
- esptool
- iot-bus-jtag
- jlink
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
- tumpa

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```ini
[env:heltec_wifi_lora_32]
platform = espressif32
board = heltec_wifi_lora_32

upload_protocol = esptool
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (*Project Configuration File*).

Heltec WiFi LoRa 32 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

<tr>
<td>RAM</td>
<td>520KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>M5Stack</td>
</tr>
</tbody>
</table>

Configuration

Please use m5stack-grey ID for *board* option in “platformio.ini” *(Project Configuration File)*:

```ini
[env:m5stack-grey]
platform = espressif32
board = m5stack-grey
```

You can override default M5Stack GREY ESP32 settings per build environment using *board_**** option, where *** is a JSON object path from board manifest m5stack-grey.json. For example, board_build.mcu, board_build.f_cpu, etc.
[env:m5stack-grey]
platform = espressif32
board = m5stack-grey

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L

Uploading

M5Stack GREY ESP32 supports the next uploading protocols:

• espota
• esptool

Default protocol is esptool

You can change upload protocol using upload_protocol option:

[env:m5stack-grey]
platform = espressif32
board = m5stack-grey

upload_protocol = esptool

Debugging

Debugging currently does not support M5Stack GREY ESP32 board.

</tbody>
</table>
Configuration

Please use `quantum` ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:quantum]
platform = espressif32
board = quantum
```

You can override default Noduino Quantum settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `quantum.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:quantum]
platform = espressif32
board = quantum

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

Noduino Quantum supports the next uploading protocols:

- espota
- esptool

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```
[env:quantum]
platform = espressif32
board = quantum

upload_protocol = esptool
```

Debugging

`Debugging` currently does not support Noduino Quantum board.

Hardware

Platform Espressif 32: Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.
## Configuration

Please use `esp32-devkitlipo` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:esp32-devkitlipo]
platform = espressif32
board = esp32-devkitlipo
```

You can override default OLIMEX ESP32-DevKit-LiPo settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `esp32-devkitlipo.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:esp32-devkitlipo]
platform = espressif32
board = esp32-devkitlipo

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

## Uploading

OLIMEX ESP32-DevKit-LiPo supports the next uploading protocols:

- esp-prog
- espota
- esptool
- iot-bus-jtag
- jlink
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
- tumpa

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:
[env:esp32-devkitlipo]
platform = espressif32
board = esp32-devkitlipo
upload_protocol = esptool

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (*Project Configuration File*).

OLIMEX ESP32-DevKit-LiPo does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</tr>
<tr>
<td>Flash</td>
<td>4MB</td>
</tr>
<tr>
<td>RAM</td>
<td>320KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Pycom Ltd.</td>
</tr>
</tbody>
</table>

Configuration

Please use `lopy` ID for `board` option in “platformio.ini” (*Project Configuration File)*:

```plaintext
[env:lopy]
platform = espressif32
board = lopy
```

You can override default Pycom LoPy settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `lopy.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```plaintext
[env:lopy]
platform = espressif32
board = lopy

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

Pycom LoPy supports the next uploading protocols:
• esp-prog
• espota
• esptool
• iot-bus-jtag
• jlink
• minimodule
• olimex-arm-usb-ocd
• olimex-arm-usb-ocd-h
• olimex-arm-usb-tiny-h
• olimex-jtag-tiny
• tumpa

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```yaml
[env:lopy]
platform = espressif32
board = lopy
upload_protocol = esptool
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Pycom LoPy does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

</tr>
</tbody>
</table>
Configuration

Please use `qchip` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:qchip]
platform = espressif32
board = qchip
```

You can override default Qchip settings per build environment using `board/***` option, where `***` is a JSON object path from board manifest `qchip.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:qchip]
platform = espressif32
board = qchip

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

Qchip supports the next uploading protocols:

- `espota`
- `esptool`

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```ini
[env:qchip]
platform = espressif32
board = qchip

upload_protocol = esptool
```

Debugging

*Debugging* currently does not support Qchip board.

<tr>
<td>Flash</td>
<td>4MB</td>
</tr>
<tr>
<td>RAM</td>
<td>320KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>TTGO</td>
</tr>
</tbody>
</table>

**Configuration**

Please use `ttgo-lora32-v2` ID for `board` option in “`platformio.ini`” (*Project Configuration File*):

```
[env:ttgo-lora32-v2]
platform = espressif32
board = ttgo-lora32-v2
```

You can override default TTGO LoRa32-OLED V2 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `ttgo-lora32-v2.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.
[env:ttgo-lora32-v2]
platform = espressif32
board = ttgo-lora32-v2

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L

Uploading

TTGO LoRa32-OLED V2 supports the next uploading protocols:

- esp-prog
- espota
- esptool
- iot-bus-jtag
- jlink
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
- tumpa

Default protocol is esptool

You can change upload protocol using upload_protocol option:

[env:ttgo-lora32-v2]
platform = espressif32
board = ttgo-lora32-v2
upload_protocol = esptool

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).
TTGO LoRa32-OLED V2 does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

</tbody>
</table>
Configuration

Please use lolin32 ID for board option in “platformio.ini” (Project Configuration File):

```Ini
[env:lolin32]
platform = espressif32
board = lolin32
```

You can override default WEMOS LOLIN32 settings per build environment using board_*** option, where *** is a JSON object path from board manifest lolin32.json. For example, board_build.mcu, board_build.f_cpu, etc.

```Ini
[env:lolin32]
platform = espressif32
board = lolin32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

WEMOS LOLIN32 supports the next uploading protocols:

- esp-prog
- espota
- esptool
- iot-bus-jtag
- jlink
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
- tumpa

Default protocol is esptool

You can change upload protocol using upload_protocol option:

```Ini
[env:lolin32]
platform = espressif32
board = lolin32

upload_protocol = esptool
```
Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

⚠️ Warning: ⚠️ You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

WEMOS LOLIN32 does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

</tr>
</tbody>
</table>

Configuration

Please use `wemos_d1_mini32` ID for `board` option in “platformio.ini” (Project Configuration File):

```
[env:wemos_d1_mini32]
platform = espressif32
board = wemos_d1_mini32
```

You can override default WeMos D1 MINI ESP32 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `wemos_d1_mini32.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:wemos_d1_mini32]
platform = espressif32
board = wemos_d1_mini32

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

WeMos D1 MINI ESP32 supports the next uploading protocols:

- esp-prog
- espota
- esptool
- iot-bus-jtag
- jlink
- minimodule
- olimex-arm-usb-ocd
- olimex-arm-usb-ocd-h
- olimex-arm-usb-tiny-h
- olimex-jtag-tiny
Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```plaintext
[env:wemos_d1_mini32]
platform = espressif32
board = wemos_d1_mini32
upload_protocol = esptool
```

### Debugging

</tbody>
</table>

Configuration

Please use `wemosbat` ID for `board` option in “platformio.ini” (Project Configuration File):

```
[env:wemosbat]
platform = espressif32
board = wemosbat
```

You can override default WeMos WiFi and Bluetooth Battery settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `wemosbat.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:wemosbat]
platform = espressif32
board = wemosbat

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

WeMos WiFi and Bluetooth Battery supports the next uploading protocols:

- esp-prog
- espota
• `esptool`
• `iot-bus-jtag`
• `jlink`
• `minimodule`
• `olimex-arm-usb-oct`
• `olimex-arm-usb-oct-h`
• `olimex-arm-usb-tiny-h`
• `olimex-jtag-tiny`
• `tumpa`

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```
[env:wemosbat]
platform = espressif32
board = wemosbat
upload_protocol = esptool
```

</tr>
</tbody>
</table>
Configuration

Please use `nina_w10` ID for `board` option in “`platformio.ini`” (Project Configuration File):

```
[env:nina_w10]
platform = espressif32
board = nina_w10
```

You can override default u-blox NINA-W10 series settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `nina_w10.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:nina_w10]
platform = espressif32
board = nina_w10

; change microcontroller
board_build.mcu = esp32

; change MCU frequency
board_build.f_cpu = 240000000L
```

Uploading

u-blox NINA-W10 series supports the next uploading protocols:

- espota
- esptool

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```
[env:nina_w10]
platform = espressif32
board = nina_w10

upload_protocol = esptool
```

Debugging

`Debugging` currently does not support u-blox NINA-W10 series board.

<td>4MB</td>
</tr>
<tr>
<td>RAM</td>
<td>80KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Espressif</td>
</tr>
</tbody>
</table>

**Configuration**

Please use `esp12e` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```ini
[env:esp12e]
platform = espressif8266
board = esp12e
```

You can override default Espressif ESP8266 ESP-12E settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `esp12e.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:esp12e]
platform = espressif8266
board = esp12e

; change microcontroller
board_build.mcu = esp8266

; change MCU frequency
board_build.f_cpu = 80000000L
```

**Uploading**

Espressif ESP8266 ESP-12E supports the next uploading protocols:

- `espota`
- `esptool`

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```ini
[env:esp12e]
platform = espressif8266
board = esp12e

upload_protocol = esptool
```

**Debugging**

`Debugging` currently does not support Espressif ESP8266 ESP-12E board.

; change MCU frequency
board_build.f_cpu = 80000000L
```

### Uploading

Olimex MOD-WIFI-ESP8266(-DEV) supports the next uploading protocols:

- `espota`
- `esptool`

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```yaml
[env:modwifi]
platform = espressif8266
board = modwifi

upload_protocol = esptool
```

### Debugging

`Debugging` currently does not support Olimex MOD-WIFI-ESP8266(-DEV) board.

### Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

</tr>
<tr>
<td>Vendor</td>
<td>Espressif</td>
</tr>
</tbody>
</table>

Configuration

Please use `phoenix_v1` ID for `board` option in “`platformio.ini`” (*Project Configuration File)*:

```ini
[env:phoenix_v1]
platform = espressif8266
board = phoenix_v1
```

You can override default Phoenix 1.0 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `phoenix_v1.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:phoenix_v1]
platform = espressif8266
board = phoenix_v1

; change microcontroller
board_build.mcu = esp8266

; change MCU frequency
board_build.f_cpu = 80000000L
```

Uploading

Phoenix 1.0 supports the next uploading protocols:

- `espota`
- `esptool`
Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```
[env:phoenix_v1]
platform = espressif8266
board = phoenix_v1
upload_protocol = esptool
```

**Debugging**

`Debugging` currently does not support Phoenix 1.0 board.

Configuration

Please use `espinotee` ID for board option in “platformio.ini” (Project Configuration File):

```
[env:espinotee]
platform = espressif8266
board = espinotee
```
You can override default ThaiEasyElec ESPino settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `espinotee.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```json
[env:espinotee]
platform = espressif8266
board = espinotee

; change microcontroller
board_build.mcu = esp8266

; change MCU frequency
board_build.f_cpu = 80000000L
```

### Uploading

ThaiEasyElec ESPino supports the next uploading protocols:

- espota
- esptool

Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```json
[env:espinotee]
platform = espressif8266
board = espinotee

upload_protocol = esptool
```

### Debugging

*Debugging* currently does not support ThaiEasyElec ESPino board.

</tbody>
</table>

Configuration

Please use `d1` ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:d1]
platform = espressif8266
board = d1
```

You can override default WEMOS D1 R1 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `d1.json`. For example, `board_build.mcu, board_build.f_cpu`, etc.

```ini
[env:d1]
platform = espressif8266
board = d1

; change microcontroller
board_build.mcu = esp8266

; change MCU frequency
board_build.f_cpu = 80000000L
```

Uploading

WEMOS D1 R1 supports the next uploading protocols:

- `espota`
- `esptool`
Default protocol is `esptool`

You can change upload protocol using `upload_protocol` option:

```yaml
[env:d1]
platform = espressif8266
board = d1
upload_protocol = esptool
```

### Debugging

`Debugging` currently does not support WEMOS D1 R1 board.

### 1.12.9 Freescale Kinetis

#### Ethernet IoT Starter Kit

**Contents**

- Ethernet IoT Starter Kit
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks

**Hardware**

Platform *Freescale Kinetis*: Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.
Microcontroller | MK64FN1M0VLL12
--- | ---
Frequency | 120MHz
Flash | 1MB
RAM | 256KB
Vendor | Freescale

**Configuration**

Please use IBMEthernetKit ID for **board** option in "platformio.ini" *(Project Configuration File)*:

```ini
[env:IBMEthernetKit]
platform = freescalekinetis
board = IBMEthernetKit
```

You can override default Ethernet IoT Starter Kit settings per build environment using **board_*** option, where *** is a JSON object path from board manifest IBMEthernetKit.json. For example, *board_build.mcu*, *board_build.f_cpu*, etc.

```ini
[env:IBMEthernetKit]
platform = freescalekinetis
board = IBMEthernetKit

; change microcontroller
board_build.mcu = mk64fn1m0vll12

; change MCU frequency
board_build.f_cpu = 12000000L
```

**Uploading**

Ethernet IoT Starter Kit supports the next uploading protocols:

- cmsis-dap
- jlink
- mbed

Default protocol is mbed

You can change upload protocol using **upload_protocol** option:

```ini
[env:IBMEthernetKit]
platform = freescalekinetis
board = IBMEthernetKit

upload_protocol = mbed
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Ethernet IoT Starter Kit has on-board debug probe and is ready for debugging. You don’t need to use/buy external debug probe.

; change microcontroller
board_build.mcu = mk143z256vlh4

; change MCU frequency
board_build.f_cpu = 48000000L

### Uploading

Freescale Kinetis FRDM-KL43Z supports the next uploading protocols:

- cmsis-dap
- jlink
- mbed

Default protocol is **mbed**

You can change upload protocol using `upload_protocol` option:

```ini
[env:frdm_kl43z]
platform = freescalekinetis
board = frdm_kl43z
upload_protocol = mbed
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” *(Project Configuration File)*.

Freescale Kinetis FRDM-KL43Z has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

Configuration

Please use `gd32vf103v-eval` ID for `board` option in “`platformio.ini`” (Project Configuration File):

```
[env:gd32vf103v-eval]
platform = gd32v
board = gd32vf103v-eval
```

You can override default GD32VF103V-EVAL settings per build environment using `board_``` option, where ``` is a JSON object path from board manifest `gd32vf103v-eval.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:gd32vf103v-eval]
platform = gd32v
board = gd32vf103v-eval
```

(continues on next page)
; change microcontroller
board_build.mcu = GD32VF103VBT6

; change MCU frequency
board_build.f_cpu = 108000000L

Uploading

GD32VF103V-EVAL supports the next uploading protocols:

- altera-usb-blaster
- gd-link
- jlink
- rv-link
- serial
- sipeed-rv-debugger
- um232h

Default protocol is gd-link

You can change upload protocol using upload_protocol option:

```
[env:gd32vf103v-eval]
platform = gd32v
board = gd32vf103v-eval
upload_protocol = gd-link
```

Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using debug_tool option in “platformio.ini” (Project Configuration File).

GD32VF103V-EVAL does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

<tr>
<td>RAM</td>
<td>20KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Sipeed</td>
</tr>
</tbody>
</table>

**Configuration**

Please use `sipeed-longan-nano-lite` ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:sipeed-longan-nano-lite]
platform = gd32v
board = sipeed-longan-nano-lite
```

You can override default Sipeed Longan Nano Lite settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `sipeed-longan-nano-lite.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:sipeed-longan-nano-lite]
platform = gd32v
board = sipeed-longan-nano-lite

; change microcontroller
board_build.mcu = GD32VF103C8T6

; change MCU frequency
board_build.f_cpu = 108000000L
```

**Uploading**

Sipeed Longan Nano Lite supports the next uploading protocols:

- `altera-usb-blaster`
- `gd-link`
- `jlink`
- `rv-link`
- `serial`
- `sipeed-rv-debugger`
- `um232h`

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```ini
[env:sipeed-longan-nano-lite]
platform = gd32v
board = sipeed-longan-nano-lite

upload_protocol = serial
```
Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (Project Configuration File).

Sipeed Longan Nano Lite does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</tr>
<tr>
<td>Vendor</td>
<td>SeeedStudio</td>
</tr>
</tbody>
</table>

Configuration

Please use `wio_lite_risc-v` ID for `board` option in “platformio.ini” (Project Configuration File):

```
[env:wio_lite_risc-v]
platform = gd32v
board = wio_lite_risc-v
```

You can override default Wio Lite RISC-V settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `wio_lite_risc-v.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:wio_lite_risc-v]
platform = gd32v
board = wio_lite_risc-v

; change microcontroller
board_build.mcu = GD32VF103CBT6

; change MCU frequency
board_build.f_cpu = 108000000L
```

Uploading

Wio Lite RISC-V supports the next uploading protocols:

- `altera-usb-blaster`
- `gd-link`
- `jlink`
- `rv-link`
- `serial`
- `sipeed-rv-debugger`
- `um232h`

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:
[env:wio_lite_risc-v]
platform = gd32v
board = wio_lite_risc-v
upload_protocol = serial

Debugging

<td>RAM</td>
<td>6MB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Sipeed</td>
</tr>
</tbody>
</table>

Configuration

Please use `sipeed-maix-bit` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```
[env:sipeed-maix-bit]
platform = kendryte210
board = sipeed-maix-bit
```

You can override default Sipeed MAIX BiT settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `sipeed-maix-bit.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:sipeed-maix-bit]
platform = kendryte210
board = sipeed-maix-bit

; change microcontroller
board_build.mcu = K210

; change MCU frequency
board_build.f_cpu = 400000000L
```

Uploading

Sipeed MAIX BiT supports the next uploading protocols:
• iot-bus-jtag
• jlink
• kflash
• minimodule
• olimex-arm-usb-oct
• olimex-arm-usb-oct-h
• olimex-arm-usb-tiny-h
• olimex-jtag-tiny
• sipeed-rv-debugger
• tumpa

Default protocol is **kflash**

You can change upload protocol using `upload_protocol` option:

```ini
[env:sipeed-maix-bit]
platform = kendryte210
board = sipeed-maix-bit
upload_protocol = kflash
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

<tr>
<td>Vendor</td>
<td>Sipeed</td>
</tr>
</tbody>
</table>
Configuration

Please use `sipeed-maix-go` ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:sipeed-maix-go]
platform = kendryte210
board = sipeed-maix-go
```

You can override default Sipeed MAIX GO settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `sipeed-maix-go.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:sipeed-maix-go]
platform = kendryte210
board = sipeed-maix-go

; change microcontroller
board_build.mcu = K210

; change MCU frequency
board_build.f_cpu = 400000000L
```

Uploading

Sipeed MAIX GO supports the next uploading protocols:

- `iot-bus-jtag`
- `jlink`
- `kflash`
- `minimodule`
- `olimex-arm-usb-ocd`
- `olimex-arm-usb-ocd-h`
- `olimex-arm-usb-tiny-h`
- `olimex-jtag-tiny`
- `sipeed-rv-debugger`
- `tumpa`

Default protocol is `kflash`

You can change upload protocol using `upload_protocol` option:

```
[env:sipeed-maix-go]
platform = kendryte210
board = sipeed-maix-go

upload_protocol = kflash
```

Debugging

`Debugging` - “1-click” solution for debugging with a zero configuration.

Sipeed MAIX ONE DOCK

Contents

- Sipeed MAIX ONE DOCK
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks
Hardware

Platform **Kendryte K210**: Kendryte K210 is an AI capable RISCV64 dual core SoC.

<table>
<thead>
<tr>
<th>Microcontroller</th>
<th>K210</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>400MHz</td>
</tr>
<tr>
<td>Flash</td>
<td>16MB</td>
</tr>
<tr>
<td>RAM</td>
<td>6MB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Sipeed</td>
</tr>
</tbody>
</table>

Configuration

Please use `sipeed-maix-one-dock` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```ini
[env:sipeed-maix-one-dock]
platform = kendryte210
board = sipeed-maix-one-dock
```

You can override default Sipeed MAIX ONE DOCK settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `sipeed-maix-one-dock.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:sipeed-maix-one-dock]
platform = kendryte210
board = sipeed-maix-one-dock

; change microcontroller
board_build.mcu = K210

; change MCU frequency
board_build.f_cpu = 400000000L
```

Uploading

Sipeed MAIX ONE DOCK supports the next uploading protocols:

- `iot-bus-jtag`
- `jlink`
- `kflash`
- `minimodule`
- `olimex-arm-usb-ocd`
- `olimex-arm-usb-ocd-h`
- `olimex-arm-usb-tiny-h`
- `olimex-jtag-tiny`
- `sipeed-rv-debugger`
- `tumpa`
Default protocol is `kflash`.

You can change upload protocol using `upload_protocol` option:

```
[env:sipeed-maix-one-dock]
platform = kendryte210
board = sipeed-maix-one-dock
upload_protocol = kflash
```

### Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

Sipeed MAIX ONE DOCK does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

<table>

1.12.15 Lattice iCE40

IceZUM Alhambra FPGA

Contents

- IceZUM Alhambra FPGA
  - Hardware
  - Configuration
  - Debugging

Hardware

Platform Lattice iCE40: The iCE40 family of ultra-low power, non-volatile FPGAs has five devices with densities ranging from 384 to 7680 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic, these devices feature Embedded Block RAM (EBR), Non-volatile Configuration Memory (NVCM) and Phase Locked Loops (PLLs). These features allow the devices to be used in low-cost, high-volume consumer and system applications.

  - Frameworks

#### Hardware

Platform *Maxim 32*: Maxim’s microcontrollers provide low-power, efficient, and secure solutions for challenging embedded applications. Maxim’s processors embed cutting-edge technologies to secure data and intellectual property, proven analog circuitry for real-world applications, and battery-conserving low power operation.
Microcontroller  |  MAX32600
---|---
Frequency  |  24MHz
Flash  |  256KB
RAM  |  32KB
Vendor  |  Maxim

### Configuration

Please use `max32600mbed` ID for `board` option in "`platformio.ini`" (Project Configuration File):

```ini
[env:max32600mbed]
platform = maxim32
board = max32600mbed
```

You can override default Maxim ARM mbed Enabled Development Platform for MAX32600 settings per build environment using `board_**` option, where `**` is a JSON object path from board manifest `max32600mbed.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:max32600mbed]
platform = maxim32
board = max32600mbed

; change microcontroller
board_build.mcu = max32600

; change MCU frequency
board_build.f_cpu = 24000000L
```

### Uploading

Maxim ARM mbed Enabled Development Platform for MAX32600 supports the next uploading protocols:

- `cmsis-dap`
- `mbed`

Default protocol is `mbed`

You can change upload protocol using `upload_protocol` option:

```ini
[env:max32600mbed]
platform = maxim32
board = max32600mbed

upload_protocol = mbed
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.
You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Maxim ARM mbed Enabled Development Platform for MAX32600 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

<tr>
<td>Vendor</td>
<td>BBC</td>
</tr>
</tbody>
</table>
**Configuration**

Please use `bbcmicrobit` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```
[env:bbcmicrobit]
platform = nordicnrf51
board = bbcmicrobit
```

You can override default BBC micro:bit settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `bbcmicrobit.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:bbcmicrobit]
platform = nordicnrf51
board = bbcmicrobit

; change microcontroller
board_build.mcu = nrf51822

; change MCU frequency
board_build.f_cpu = 16000000L
```

**Uploading**

BBC micro:bit supports the next uploading protocols:

- cmsis-dap
- jlink
- mbed

Default protocol is `cmsis-dap`

You can change upload protocol using `upload_protocol` option:

```
[env:bbcmicrobit]
platform = nordicnrf51
board = bbcmicrobit

upload_protocol = cmsis-dap
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” *(Project Configuration File)*.

BBC micro:bit has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.
Compatible Tools | On-board | Default
--- | --- | ---
CMSIS-DAP | Yes | Yes
J-LINK |  |

Configuration

Please use nrf51_dongle ID for *board* option in “platformio.ini” (Project Configuration File):

```
[env:nrf51_dongle]
platform = nordicnrf51
board = nrf51_dongle
```

You can override default Nordic nRF51 Dongle (PCA10031) settings per build environment using *board_*** option, where *** is a JSON object path from board manifest nrf51_dongle.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:nrf51_dongle]
platform = nordicnrf51
board = nrf51_dongle

; change microcontroller
board_build.mcu = nrf51822

; change MCU frequency
board_build.f_cpu = 32000000L
```

Uploading

Nordic nRF51 Dongle (PCA10031) supports the next uploading protocols:

- cmsis-dap
- jlink
- mbed
- nrfjprog

Default protocol is jlink

You can change upload protocol using *upload_protocol* option:

```
[env:nrf51_dongle]
platform = nordicnrf51
board = nrf51_dongle

upload_protocol = jlink
```
Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Nordic nRF51 Dongle (PCA10031) has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

<tr>
<td>Flash</td>
<td>256KB</td>
</tr>
<tr>
<td>RAM</td>
<td>32KB</td>
</tr>
</tbody>
</table>
Configuration

Please use Sinobit ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:Sinobit]
platform = nordicnrf51
board = Sinobit
```

You can override default Sino:Bit settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest Sinobit.json. For example, `board_build.mcu, board_build.f_cpu`, etc.

```ini
[env:Sinobit]
platform = nordicnrf51
board = Sinobit

; change microcontroller
board_build.mcu = nrf51822

; change MCU frequency
board_build.f_cpu = 32000000L
```

Uploading

Sino:Bit supports the next uploading protocols:

- blackmagic
- jlink
- nrfjprog
- stlink

Default protocol is `jlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:Sinobit]
platform = nordicnrf51
board = Sinobit

upload_protocol = jlink
```

Debugging

`Debugging` - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

Sino:Bit does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Adafruit CLUE nRF52840

Contents

- Adafruit CLUE nRF52840
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks

Hardware

Platform Nordic nRF52: The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.
### Configuration

Please use `adafruit_clue_nrf52840` ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:adafruit_clue_nrf52840]
platform = nordicnrf52
board = adafruit_clue_nrf52840
```

You can override default Adafruit CLUE nRF52840 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `adafruit_clue_nrf52840.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:adafruit_clue_nrf52840]
platform = nordicnrf52
board = adafruit_clue_nrf52840

; change microcontroller
board_build.mcu = nrf52840

; change MCU frequency
board_build.f_cpu = 64000000L
```

### Uploading

Adafruit CLUE nRF52840 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- nrfjprog
- nrfutil
- stlink

Default protocol is `nrfutil`

You can change upload protocol using `upload_protocol` option:

```ini
[env:adafruit_clue_nrf52840]
platform = nordicnrf52
board = adafruit_clue_nrf52840

upload_protocol = nrfutil
```
Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Adafruit CLUE nRF52840 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use `adafruit_cplaynrf52840` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:adafruit_cplaynrf52840]
platform = nordicnrf52
board = adafruit_cplaynrf52840
```

You can override default Circuit Playground Bluefruit settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `adafruit_cplaynrf52840.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:adafruit_cplaynrf52840]
platform = nordicnrf52
board = adafruit_cplaynrf52840

; change microcontroller
board_build.mcu = nrf52840

; change MCU frequency
board_build.f_cpu = 64000000L
```

Uploading

Circuit Playground Bluefruit supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- nrfjprog
- nrfutil
- stlink

Default protocol is `nrfutil`

You can change upload protocol using `upload_protocol` option:

```ini
[env:adafruit_cplaynrf52840]
platform = nordicnrf52
board = adafruit_cplaynrf52840

upload_protocol = nrfutil
```

Debugging

PlatformIO Documentation, Release 5.0.5a1

Configuration

Please use delta_dfbm_nq620 ID for board option in "platformio.ini" (Project Configuration File):

```
[env:delta_dfbm_nq620]
platform = nordicnrf52
board = delta_dfbm_nq620
```

You can override default Delta DFBM-NQ620 settings per build environment using board_*** option, where *** is a JSON object path from board manifest delta_dfbm_nq620.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:delta_dfbm_nq620]
platform = nordicnrf52
board = delta_dfbm_nq620

; change microcontroller
board_build.mcu = nrf52832

; change MCU frequency
board_build.f_cpu = 64000000L
```

Uploading

Delta DFBM-NQ620 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- nrfjprog
- stlink

Default protocol is cmsis-dap

You can change upload protocol using upload_protocol option:

```
[env:delta_dfbm_nq620]
platform = nordicnrf52
board = delta_dfbm_nq620

upload_protocol = cmsis-dap
```

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.
You can switch between debugging Tools & Debug Probes using `debug_tool` option in “`platformio.ini`” (Project Configuration File).

Delta DFBM-NQ620 has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

Please use `adafruit_metro_nrf52840` ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:adafruit_metro_nrf52840]
platform = nordicnrf52
board = adafruit_metro_nrf52840
```
You can override default Metro nRF52840 Express settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `adafruit_metro_nrf52840.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```plaintext
[env:adafruit_metro_nrf52840]
platform = nordicnrf52
board = adafruit_metro_nrf52840

; change microcontroller
board_build.mcu = nrf52840

; change MCU frequency
board_build.f_cpu = 64000000L
```

## Uploading

Metro nRF52840 Express supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- nrfjprog
- nrfutil
- stlink

Default protocol is `nrfutil`

You can change upload protocol using `upload_protocol` option:

```plaintext
[env:adafruit_metro_nrf52840]
platform = nordicnrf52
board = adafruit_metro_nrf52840

upload_protocol = nrfutil
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in "platformio.ini" *(Project Configuration File)*.

Metro nRF52840 Express does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.
Compatible Tools | On-board | Default
---|---|---
*Black Magic Probe* | Yes | |
CMSIS-DAP | | |
J-LINK | | |
ST-LINK | | |

RedBearLab BLE Nano 2

Contents

- RedBearLab BLE Nano 2
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks

Hardware

Platform Nordic nRF52: The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.

<table>

</tbody>
</table>

Configuration

Please use redbear_blenano2 ID for board option in “platformio.ini” (Project Configuration File):

```
[env:redbear_blenano2]
platform = nordicnrf52
board = redbear_blenano2
```

You can override default RedBearLab BLE Nano 2 settings per build environment using board_*** option, where *** is a JSON object path from board manifest redbear_blenano2.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:redbear_blenano2]
platform = nordicnrf52
board = redbear_blenano2
```

(continues on next page)
; change microcontroller
board_build.mcu = nrf52832

; change MCU frequency
board_build.f_cpu = 64000000L

Uploading

RedBearLab BLE Nano 2 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- nrfjprog
- stlink

Default protocol is cmsis-dap

You can change upload protocol using upload_protocol option:

```
[env:redbear_blenano2]
platform = nordicnrf52
board = redbear_blenano2
upload_protocol = cmsis-dap
```

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

RedBearLab BLE Nano 2 has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

Configuration

Please use reel_board_v2 ID for board option in “platformio.ini” (Project Configuration File):

```ini
[env:reel_board_v2]
platform = nordicnrf52
board = reel_board_v2
```

You can override default reel_board_v2 settings per build environment using board_*** option, where *** is a JSON object path from board manifest reel_board_v2.json. For example, board_build.mcu, board_build.f_cpu, etc.

```ini
[env:reel_board_v2]
platform = nordicnrf52
board = reel_board_v2
```

(continues on next page)
Uploading

reel_board_v2 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- nrfjprog
- stlink

Default protocol is cmsis-dap

You can change upload protocol using upload_protocol option:

```ini
[env:reel_board_v2]
platform = nordicnrf52
board = reel_board_v2
upload_protocol = cmsis-dap
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using debug_tool option in “platformio.ini” (Project Configuration File).

reel_board_v2 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

; change MCU frequency
board_build.f_cpu = 600000000L
```

Uploading

NXP i.MX RT1050 Evaluation Kit supports the next uploading protocols:

- blackmagic
- jlink
- mbed

Default protocol is `mbed`

You can change upload protocol using `upload_protocol` option:
Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

NXP i.MX RT1050 Evaluation Kit has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

NXP LPC800-MAX has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

</tr>
</tbody>
</table>

Configuration

Please use `lpc1549` ID for board option in “platformio.ini” (Project Configuration File):

```
[env:lpc1549]
platform = nxplpc
board = lpc1549
```

You can override default NXP LPCXpresso1549 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `lpc1549.json`. For example, `board_build.mcu,board_build.f_cpu`, etc.
[env: lpc1549]
platform = nxplpc
board = lpc1549

; change microcontroller
board_build.mcu = lpc1549

; change MCU frequency
board_build.f_cpu = 72000000L

**Uploading**

NXP LPCXpresso1549 supports the next uploading protocols:

- blackmagic
- jlink
- mbed

Default protocol is mbed

You can change upload protocol using `upload_protocol` option:

[env: lpc1549]
platform = nxplpc
board = lpc1549

upload_protocol = mbed

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” *(Project Configuration File)*.

NXP LPCXpresso1549 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use `seeedArchPro` ID for `board` option in “platformio.ini” (Project Configuration File): 

```
[env:seeedArchPro]
platform = nxplpc
board = seeedArchPro
```

You can override default Seeed Arch Pro settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `seeedArchPro.json`. For example, `board_build.mcu, board_build.f_cpu`, etc.
Uploading

Seeed Arch Pro supports the next uploading protocols:

- cmsis-dap
- mbed

Default protocol is mbed

You can change upload protocol using upload_protocol option:

```
[env:seeedArchPro]
platform = nxplpc
board = seeedArchPro
upload_protocol = mbed
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Seeed Arch Pro has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

You can override default Artix-7 35T Arty FPGA Evaluation Kit settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `artix7_35t.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:artix7_35t]
platform = shakti
board = artix7_35t

; change microcontroller
board_build.mcu = E-Class

; change MCU frequency
board_build.f_cpu = 50000000L
```

Uploading

Artix-7 35T Arty FPGA Evaluation Kit supports the next uploading protocols:

- ftdi
- ftdi
- jlink
- jlink

Default protocol is ftdi.

You can change upload protocol using `upload_protocol` option:
Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in "platformio.ini" *(Project Configuration File)*.

Artix-7 35T Arty FPGA Evaluation Kit has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

Please use `sparkfun_thing_plus_v` ID for `board` option in `platformio.ini` (Project Configuration File):

```ini
[env:sparkfun_thing_plus_v]
platform = sifive
board = sparkfun_thing_plus_v
```
You can override default SparkFun RED-V Thing Plus settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `sparkfun_thing_plus_v.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```yaml
[env:sparkfun_thing_plus_v]
platform = sifive
board = sparkfun_thing_plus_v

; change microcontroller
board_build.mcu = fe310

; change MCU frequency
board_build.f_cpu = 320000000L
```

### Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “`platformio.ini` (Project Configuration File).

SparkFun RED-V Thing Plus has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

### 1.12.27 Silicon Labs EFM32

**EFM32GG-STK3700 Giant Gecko**
**Hardware**

Platform *Silicon Labs EFM32*: Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to 48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features innovative low energy techniques, short wake-up time from energy saving modes and a wide selection of peripherals, making it ideal for battery operated applications and other systems requiring high performance and low-energy consumption.

### Frameworks

**Mbed**

Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices.

1.12.28 ST STM32

1Bitsy

Contents

- 1Bitsy
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks

Hardware

Platform *ST STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

<table>
<thead>
<tr>

<td>1BitSquared</td>
</tr>
</tbody>
</table>

Configuration

Please use `1bitsy_stm32f415rgt` ID for `board` option in “`platformio.ini`” (Project Configuration File):

```
[env:1bitsy_stm32f415rgt]
platform = ststm32
board = 1bitsy_stm32f415rgt
```

You can override default 1Bitsy settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `1bitsy_stm32f415rgt.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.
[env:1bitsy_stm32f415rgt]
platform = ststm32
board = 1bitsy_stm32f415rgt

; change microcontroller
board_build.mcu = stm32f415rgt

; change MCU frequency
board_build.f_cpu = 168000000L

Uploading

1Bitsy supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is blackmagic

You can change upload protocol using upload_protocol option:

[env:1bitsy_stm32f415rgt]
platform = ststm32
board = 1bitsy_stm32f415rgt

upload_protocol = blackmagic

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using debug_tool option in *platformio.ini* (Project Configuration File).

1Bitsy does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

  - Debugging
  - Frameworks

### Hardware

Platform *ST STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.
**Microcontroller** | STM32F401VGT6  
---|---
**Frequency** | 84MHz  
**Flash** | 512KB  
**RAM** | 96KB  
**Vendor** | ST

**Configuration**

Please use `st3dp001_eval` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:st3dp001_eval]
platform = ststm32
board = st3dp001_eval
```

You can override default 3DP001V1 Evaluation board for 3D printer settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `st3dp001_eval.json`. For example, `board_build.mcu, board_build.f_cpu`, etc.

```ini
[env:st3dp001_eval]
platform = ststm32
board = st3dp001_eval

; change microcontroller
board_build.mcu = stm32f401vgt6

; change MCU frequency
board_build.f_cpu = 84000000L
```

**Uploading**

3DP001V1 Evaluation board for 3D printer supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:st3dp001_eval]
platform = ststm32
board = st3dp001_eval

upload_protocol = stlink
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

3DP001V1 Evaluation board for 3D printer has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

PlatformIO Documentation, Release 5.0.5a1

Hardware

Platform *ST STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

<table>

<tr>
<td>Vendor</td>
<td>96Boards</td>
</tr>
</tbody>
</table>

Configuration

Please use `b96b_argonkey` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```
[env:b96b_argonkey]
platform = ststm32
board = b96b_argonkey
```

You can override default 96Boards Argonkey (STEV-AL-MKI187V1) settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `b96b_argonkey.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:b96b_argonkey]
platform = ststm32
board = b96b_argonkey

; change microcontroller
board_build.mcu = stm32f412cg

; change MCU frequency
board_build.f_cpu = 100000000L
```

Uploading

96Boards Argonkey (STEV-AL-MKI187V1) supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:
Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

96Boards Argonkey (STEV AL-MKI187V1) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is **blackmagic**

You can change upload protocol using `upload_protocol` option:

```ini
[env:armstrap_eagle1024]
platform = ststm32
board = armstrap_eagle1024

upload_protocol = blackmagic
```

# Debugging

`Debugging` - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

Armstrap Eagle 1024 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

## Hardware

Platform **ST STM32**: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.
Microcontroller | STM32F427VIT6  
--- | ---  
Frequency | 168MHz  
Flash | 1.99MB  
RAM | 256KB  
Vendor | Armstrap

**Configuration**

Please use `armstrap_eagle2048` ID for `board` option in “`platformio.ini`” (Project Configuration File):

```
[env:armstrap_eagle2048]
platform = ststm32
board = armstrap_eagle2048
```

You can override default Armstrap Eagle 2048 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `armstrap_eagle2048.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:armstrap_eagle2048]
platform = ststm32
board = armstrap_eagle2048

; change microcontroller
board_build.mcu = stm32f427vit6

; change MCU frequency
board_build.f_cpu = 168000000L
```

**Uploading**

Armstrap Eagle 2048 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is blackmagic

You can change upload protocol using `upload_protocol` option:

```
[env:armstrap_eagle2048]
platform = ststm32
board = armstrap_eagle2048

upload_protocol = blackmagic
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Armstrap Eagle 2048 has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

board = blackpill_f103c8

; change microcontroller
board_build.mcu = stm32f103c8t6

; change MCU frequency
board_build.f_cpu = 72000000L
```

Uploading

BlackPill F103C8 supports the next uploading protocols:
• blackmagic
• cmsis-dap
• jlink
• serial
• stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```
[env:blackpill_f103c8]
platform = ststm32
board = blackpill_f103c8
upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

BlackPill F103C8 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</tbody>
</table>

Configuration

Please use `bluepill_f103c8` ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:bluepill_f103c8]
platform = ststm32
board = bluepill_f103c8
```

You can override default BluePill F103C8 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `bluepill_f103c8.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:bluepill_f103c8]
platform = ststm32
board = bluepill_f103c8

; change microcontroller
board_build.mcu = stm32f103c8t6

; change MCU frequency
board_build.f_cpu = 72000000L
```

Uploading

BluePill F103C8 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- dfu
- jlink
- mbed
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:
[env:bluepill_f103c8]
platform = stm32
board = bluepill_f103c8
upload_protocol = stlink

---

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (*Project Configuration File*).

BluePill F103C8 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Hardware

Platform *STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

<table>

<td>Electrosmith</td>
</tr>
</tbody>
</table>

Configuration

Please use `electrosmith_daisy` ID for *board* option in “platformio.ini” (Project Configuration File):

```
[env:electrosmith_daisy]
platform = ststm32
board = electrosmith_daisy
```

You can override default Electrosmith Daisy settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `electrosmith_daisy.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:electrosmith_daisy]
platform = ststm32
board = electrosmith_daisy

; change microcontroller
board_build.mcu = stm32h750ibk6

; change MCU frequency
board_build.f_cpu = 400000000L
```

Uploading

Electrosmith Daisy supports the next uploading protocols:

- `blackmagic`
- `cmsis-dap`
- `jlink`
- `mbed`
- `stlink`

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:
[env:electrosmith_daisy]
platform = stm32
board = electrosmith_daisy
upload_protocol = stlink

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Electrosmith Daisy does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Configuration

Please use `elmo_f411re` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```
[env:elmo_f411re]
platform = ststm32
board = elmo_f411re
```

You can override default Espotel LoRa Module settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `elmo_f411re.json`. For example, `board_build.mcu, board_build.f_cpu, etc.`

```
[env:elmo_f411re]
platform = ststm32
board = elmo_f411re

; change microcontroller
board_build.mcu = stm32f411ret6

; change MCU frequency
board_build.f_cpu = 100000000L
```

Uploading

Espotel LoRa Module supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink
Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:elmo_f411re]
platform = ststm32
board = elmo_f411re
upload_protocol = stlink
```

### Debugging

board = rhombio_l476dmw1k
```

You can override default L476DMW1K settings per build environment using board_*** option, where *** is a JSON object path from board manifest rhombio_l476dmw1k.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:rhombio_l476dmw1k]
platform = ststm32
board = rhombio_l476dmw1k

; change microcontroller
board_build.mcu = stm32l476vgt6

; change MCU frequency
board_build.f_cpu = 80000000L
```

Uploading

L476DMW1K supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is cmsis-dap

You can change upload protocol using upload_protocol option:

```
[env:rhombio_l476dmw1k]
platform = ststm32
board = rhombio_l476dmw1k
```

(continues on next page)
upload_protocol = cmsis-dap

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

L476DMW1K has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

Default protocol is `dfu`

You can change upload protocol using `upload_protocol` option:
PlatformIO Documentation, Release 5.0.5a1

```
[env:maple_ret6]
platform = stm32
board = maple_ret6
upload_protocol = dfu
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Maple (RET6) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

**Maple Mini Bootloader 2.0**
PlatformIO Documentation, Release 5.0.5a1

Contents

- *Maple Mini Bootloader 2.0*
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks

Hardware

Platform *ST STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

<table>

<td>LeafLabs</td>
</tr>
</tbody>
</table>

Configuration

Please use `maple_mini_b20` ID for `board` option in "`platformio.ini` (Project Configuration File):

```ini
[env:maple_mini_b20]
platform = ststm32
board = maple_mini_b20
```

You can override default Maple Mini Bootloader 2.0 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `maple_mini_b20.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:maple_mini_b20]
platform = ststm32
board = maple_mini_b20

; change microcontroller
board_build.mcu = stm32f103cbt6

; change MCU frequency
board_build.f_cpu = 72000000L
```

Uploading

Maple Mini Bootloader 2.0 supports the next uploading protocols:
- blackmagic
- cmsis-dap
- dfu
- jlink
- stlink

Default protocol is dfu

You can change upload protocol using `upload_protocol` option:

```
[env:maple_mini_b20]
platform = ststm32
board = maple_mini_b20
upload_protocol = dfu
```

</table>

Configuration

Please use `maple_mini_origin` ID for `board` option in “platformio.ini” *(Project Configuration File)*:
You can override default Maple Mini Original settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `maple_mini_origin.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:maple_mini_origin]
platform = ststm32
board = maple_mini_origin

; change microcontroller
board_build.mcu = stm32f103c8t6

; change MCU frequency
board_build.f_cpu = 72000000L
```

### Uploading

Maple Mini Original supports the next uploading protocols:

- blackmagic
- cmsis-dap
- dfu
- jlink
- serial
- stlink

Default protocol is dfu

You can change upload protocol using `upload_protocol` option:

```ini
[env:maple_mini_origin]
platform = ststm32
board = maple_mini_origin

upload_protocol = dfu
```

### Debugging

**Hardware**

Platform **ST STM32**: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.
### Configuration

Please use `mbed_connect_odin` ID for `board` option in “`platformio.ini`” (Project Configuration File):

```ini
[env:mbed_connect_odin]
platform = ststm32
board = mbed_connect_odin
```

You can override default Mbed Connect Cloud settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `mbed_connect_odin.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:mbed_connect_odin]
platform = ststm32
board = mbed_connect_odin

; change microcontroller
board_build.mcu = ststm32f439ziy6

; change MCU frequency
board_build.f_cpu = 168000000L
```

### Uploading

Mbed Connect Cloud supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:mbed_connect_odin]
platform = ststm32
board = mbed_connect_odin

upload_protocol = stlink
```

### Debugging

*Debugging*- “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Mbed Connect Cloud has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

</tbody>
</table>

**Configuration**

Please use `microduino32_flash` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:microduino32_flash]
platform = ststm32
board = microduino32_flash
```

You can override default Microduino Core STM32 to Flash settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `microduino32_flash.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:microduino32_flash]
platform = ststm32
board = microduino32_flash

; change microcontroller
board_build.mcu = stm32f103cbt6

; change MCU frequency
board_build.f_cpu = 72000000L
```

**Uploading**

Microduino Core STM32 to Flash supports the next uploading protocols:

- blackmagic
- cmsis-dap
- dfu
- jlink
- stlink

Default protocol is `dfu`

You can change upload protocol using `upload_protocol` option:

```ini
[env:microduino32_flash]
platform = ststm32
board = microduino32_flash

upload_protocol = dfu
```

Configuration

Please use `xdot_l151cc` ID for *board* option in “`platformio.ini`” (Project Configuration File):

```
[env:xdot_l151cc]
platform = ststm32
board = xdot_l151cc
```
You can override default MultiTech xDot settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `xdot_l151cc.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:xdot_l151cc]
platform = ststm32
board = xdot_l151cc

; change microcontroller
board_build.mcu = stm32l151ccu6

; change MCU frequency
board_build.f_cpu = 32000000L
```

### Uploading

MultiTech xDot supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```
[env:xdot_l151cc]
platform = ststm32
board = xdot_l151cc

upload_protocol = stlink
```

### Debugging

<td>Olimex</td>
</tr>
</tbody>
</table>
Configuration

Please use `olimexino` ID for `board` option in “`platformio.ini`” (Project Configuration File):

```
[env:olimexino]
platform = ststm32
board = olimexino
```

You can override default OLIMEXINO-STM32 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `olimexino.json`. For example, `board_build.mcu, board_build.f_cpu, etc.`

```
[env:olimexino]
platform = ststm32
board = olimexino

; change microcontroller
board_build.mcu = stm32f103rbt6

; change MCU frequency
board_build.f_cpu = 72000000L
```

Uploading

OLIMEXINO-STM32 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```
[env:olimexino]
platform = ststm32
board = olimexino

upload_protocol = stlink
```

Debugging

```

**Uploading**

PYBStick Lite 26 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- dfu
- jlink
- serial
- stlink
Default protocol is \texttt{stlink}

You can change upload protocol using \texttt{upload_protocol} option:

```
[env:pybstick26_lite]
platform = ststm32
board = pybstick26_lite
upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using \texttt{debug_tool} option in “platformio.ini” (Project Configuration File).

PYBStick Lite 26 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use pybstick26_std ID for board option in "platformio.ini" (Project Configuration File):

```
[env:pybstick26_std]
platform = ststm32
board = pybstick26_std
```

You can override default PYBStick Standard 26 settings per build environment using board_*** option, where *** is a JSON object path from board manifest pybstick26_std.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:pybstick26_std]
platform = ststm32
board = pybstick26_std

; change microcontroller
board_build.mcu = stm32f411ceu6

; change MCU frequency
board_build.f_cpu = 100000000L
```
Uploading

PYBStick Standard 26 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- dfu
- jlink
- serial
- stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```ini
[env:pybstick26_std]
platform = ststm32
board = pybstick26_std
upload_protocol = stlink
```

Debugging

Configuration

Please use `cloud_jam_l4` ID for `board` option in "`platformio.ini`" (Project Configuration File):

```ini
[env:cloud_jam_l4]
platform = ststm32
board = cloud_jam_l4
```

You can override default RushUp Cloud-JAM L4 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `cloud_jam_l4.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:cloud_jam_l4]
platform = ststm32
board = cloud_jam_l4

; change microcontroller
board_build.mcu = stm32l476rgt6

; change MCU frequency
board_build.f_cpu = 80000000L
```

Uploading

RushUp Cloud-JAM L4 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
• stlink

Default protocol is stlink

You can change upload protocol using upload_protocol option:

```yaml
[env:cloud_jam_l4]
platform = ststm32
board = cloud_jam_l4
upload_protocol = stlink
```

## Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using debug_tool option in **“platformio.ini” (Project Configuration File)**.

RushUp Cloud-JAM L4 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

platform = ststm32
board = disco_f469ni

; change microcontroller
board_build.mcu = stm32f469nih6

; change MCU frequency
board_build.f_cpu = 180000000L
```

Uploading

ST 32F469IDISCOVERY supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is stlink

You can change upload protocol using upload_protocol option:

```
[env:disco_f469ni]
platform = ststm32
board = disco_f469ni

upload_protocol = stlink
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using debug_tool option in “platformio.ini” (Project Configuration File).
ST 32F469IDISCOVERY has on-board debug probe and is ready for debugging. You don’t need to use/buy external debug probe.

Configuration

Please use disco_l475vg_iot01a ID for board option in “platformio.ini” (Project Configuration File):

```ini
[env:disco_l475vg_iot01a]
platform = ststm32
board = disco_l475vg_iot01a
```

You can override default ST B-L475E-IOT01A Discovery kit settings per build environment using board_*** option, where *** is a JSON object path from board manifest disco_l475vg_iot01a.json. For example, board_build.mcu, board_build.f_cpu, etc.

```ini
[env:disco_l475vg_iot01a]
platform = ststm32
board = disco_l475vg_iot01a

; change microcontroller
board_build.mcu = stm32l475vgt6

; change MCU frequency
board_build.f_cpu = 80000000L
```
Uploading

ST B-L475E-IOT01A Discovery kit supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```
[env:disco_l475vg_iot01a]
platform = ststm32
board = disco_l475vg_iot01a
upload_protocol = stlink
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

ST B-L475E-IOT01A Discovery kit has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

Hardware

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

Configuration

Please use nucleo_f070rb ID for board option in “platformio.ini” (Project Configuration File):

```ini
[env:nucleo_f070rb]
platform = ststm32
board = nucleo_f070rb
```

You can override default ST Nucleo F070RB settings per build environment using board_*** option, where *** is a JSON object path from board manifest nucleo_f070rb.json. For example, board_build.mcu, board_build.f_cpu, etc.

```ini
[env:nucleo_f070rb]
platform = ststm32
board = nucleo_f070rb

; change microcontroller
board_build.mcu = stm32f070rbt6

; change MCU frequency
board_build.f_cpu = 48000000L
```

Uploading

ST Nucleo F070RB supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink
Default protocol is *stlink*

You can change upload protocol using *upload_protocol* option:

```
[env:nucleo_f070rb]
platform = stm32
board = nucleo_f070rb
upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in “*platformio.ini*” (Project Configuration File).

ST Nucleo F070RB has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

Hardware

Platform *ST STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

Configuration

Please use `nucleo_f303k8` ID for *board* option in “platformio.ini” (*Project Configuration File)*:

```ini
[env:nucleo_f303k8]
platform = ststm32
board = nucleo_f303k8
```

You can override default ST Nucleo F303K8 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `nucleo_f303k8.json`. For example, `board_build.mcu, board_build.f_cpu`, etc.

```ini
[env:nucleo_f303k8]
platform = ststm32
board = nucleo_f303k8

; change microcontroller
board_build.mcu = stm32f303k8t6

; change MCU frequency
board_build.f_cpu = 72000000L
```

Uploading

ST Nucleo F303K8 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:
Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in “platformio.ini” (Project Configuration File).

ST Nucleo F303K8 has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink
Default protocol is `stlink`.

You can change upload protocol using `upload_protocol` option:

```ini
[env:nucleo_f411re]
platform = ststm32
board = nucleo_f411re
upload_protocol = stlink
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “`platformio.ini`” (*Project Configuration File)*.

ST Nucleo F411RE has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

Hardware

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

Configuration

Please use nucleo_f722ze ID for board option in "platformio.ini" (Project Configuration File):

```
[env:nucleo_f722ze]
platform = ststm32
board = nucleo_f722ze
```

You can override default ST Nucleo F722ZE settings per build environment using board_*** option, where *** is a JSON object path from board manifest nucleo_f722ze.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:nucleo_f722ze]
platform = ststm32
board = nucleo_f722ze

; change microcontroller
board_build.mcu = stm32f722zet6

; change MCU frequency
board_build.f_cpu = 216000000L
```
Uploading

ST Nucleo F722ZE supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is stlink.

You can change upload protocol using `upload_protocol` option:

```ini
[env:nucleo_f722ze]
platform = ststm32
board = nucleo_f722ze
upload_protocol = stlink
```

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

ST Nucleo F722ZE has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

board = nucleo_l011k4

; change microcontroller
board_build.mcu = stm32l011k4t6

; change MCU frequency
board_build.f_cpu = 32000000L
```

Uploading

ST Nucleo L011K4 supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```ini
[env:nucleo_l011k4]
platform = ststm32
board = nucleo_l011k4
```

(continues on next page)
upload_protocol = stlink

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in “platformio.ini” *(Project Configuration File)*.

ST Nucleo L011K4 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

### Hardware

Platform **ST STM32**: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-
time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

</tr>
</tbody>
</table>

**Configuration**

Please use nucleo_l433rc_p ID for `board` option in **“platformio.ini” (Project Configuration File):**

```
[env:nucleo_l433rc_p]
platform = ststm32
board = nucleo_l433rc_p
```

You can override default ST Nucleo L433RC-P settings per build environment using `board_***` option, where *** is a JSON object path from board manifest nucleo_l433rc_p.json. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:nucleo_l433rc_p]
platform = ststm32
board = nucleo_l433rc_p

; change microcontroller
board_build.mcu = stm32l433rc

; change MCU frequency
board_build.f_cpu = 80000000L
```

**Uploading**

ST Nucleo L433RC-P supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```
[env:nucleo_l433rc_p]
platform = ststm32
board = nucleo_l433rc_p

upload_protocol = stlink
```
Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in *“platformio.ini” (Project Configuration File)*.

ST Nucleo L433RC-P has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

```
[env:nucleo_l4r5zi]
platform = ststm32
board = nucleo_l4r5zi

; change microcontroller
board_build.mcu = stm32l4r5zit6

; change MCU frequency
board_build.f_cpu = 120000000L
```
Uploading

ST Nucleo L4R5ZI supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- mbed
- stlink

Default protocol is **stlink**

You can change upload protocol using `upload_protocol` option:

```plaintext
[env:nucleo_l4r5zi]
platform = ststm32
board = nucleo_l4r5zi
upload_protocol = stlink
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

ST Nucleo L4R5ZI has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

</tr>
</tbody>
</table>
Configuration

Please use disco_l152rb ID for board option in “platformio.ini” (Project Configuration File):

```ini
[env:disco_l152rb]
platform = ststm32
board = disco_l152rb
```

You can override default ST STM32LDISCOVERY settings per build environment using board_*** option, where *** is a JSON object path from board manifest disco_l152rb.json. For example, board_build.mcu, board_build.f_cpu, etc.

```ini
[env:disco_l152rb]
platform = ststm32
board = disco_l152rb

; change microcontroller
board_build.mcu = stm32l152rbt6

; change MCU frequency
board_build.f_cpu = 32000000L
```

Uploading

ST STM32LDISCOVERY supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is stlink

You can change upload protocol using upload_protocol option:

```ini
[env:disco_l152rb]
platform = ststm32
board = disco_l152rb

upload_protocol = stlink
```

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).
ST STM32LDISCOVERY has on-board debug probe and is ready for debugging. You don’t need to use/buy external debug probe.

</tbody>
</table>

Configuration

Please use eval_f373vc ID for board option in “platformio.ini” (Project Configuration File):
You can override default STM32373C-EVAL settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `eval_f373vc.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:eval_f373vc]
platform = ststm32
board = eval_f373vc

; change microcontroller
board_build.mcu = stm32f373vct6

; change MCU frequency
board_build.f_cpu = 72000000L
```

### Uploading

STM32373C-EVAL supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:eval_f373vc]
platform = ststm32
board = eval_f373vc

upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” *(Project Configuration File)*.

STM32373C-EVAL does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

**Hardware**

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.
Configuration

Please use *eval_f072vb* ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:eval_f072vb]
platform = ststm32
board = eval_f072vb
```

You can override default STM32F072-EVAL settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `eval_f072vb.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.:

```
[env:eval_f072vb]
platform = ststm32
board = eval_f072vb

; change microcontroller
board_build.mcu = stm32f072vbt6

; change MCU frequency
board_build.f_cpu = 48000000L
```

Uploading

STM32F072-EVAL supports the next uploading protocols:

- blackmagic
- cmsis-dap
- jlink
- stlink

Default protocol is *stlink*

You can change upload protocol using `upload_protocol` option:

```
[env:eval_f072vb]
platform = ststm32
board = eval_f072vb

upload_protocol = stlink
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Configuration**

Please use `genericSTM32F103C6` ID for `board` option in “`platformio.ini` (Project Configuration File):

```ini
[env:genericSTM32F103C6]
platform = ststm32
board = genericSTM32F103C6
```

You can override default STM32F103C6 (10k RAM. 32k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F103C6.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:genericSTM32F103C6]
platform = ststm32
board = genericSTM32F103C6

; change microcontroller
board_build.mcu = stm32f103c6

; change MCU frequency
board_build.f_cpu = 72000000L
```

**Uploading**

STM32F103C6 (10k RAM. 32k Flash) supports the next uploading protocols:

- blackmagic
- dfu

1.12. Boards
Default protocol is serial

You can change upload protocol using `upload_protocol` option:

```
[env:genericSTM32F103C6]
platform = ststm32
board = genericSTM32F103C6
upload_protocol = serial
```

### Debugging

</tbody>
</table>

**Configuration**

Please use `genericSTM32F103R4` ID for `board` option in "`platformio.ini` (Project Configuration File):

```ini
[env:genericSTM32F103R4]
platform = ststm32
board = genericSTM32F103R4
```

You can override default STM32F103R4 (6k RAM, 16k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F103R4.json`. For example, `board_build.mcu,board_build.f_cpu`, etc.

```ini
[env:genericSTM32F103R4]
platform = ststm32
board = genericSTM32F103R4

; change microcontroller
board_build.mcu = stm32f103r4

; change MCU frequency
board_build.f_cpu = 72000000L
```

**Uploading**

STM32F103R4 (6k RAM, 16k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```ini
[env:genericSTM32F103R4]
platform = ststm32
board = genericSTM32F103R4

upload_protocol = serial
```
Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using **debug_tool** option in “platformio.ini” (Project Configuration File).

STM32F103R4 (6k RAM, 16k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Hardware

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

</tr>
</tbody>
</table>

Configuration

Please use genericSTM32F103RF ID for board option in “platformio.ini” (Project Configuration File):
You can override default STM32F103RF (96k RAM. 768k Flash) settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `genericSTM32F103RF.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:genericSTM32F103RF]
platform = ststm32
board = genericSTM32F103RF

; change microcontroller
board_build.mcu = stm32f103rf

; change MCU frequency
board_build.f_cpu = 72000000L
```

### Uploading

STM32F103RF (96k RAM. 768k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```ini
[env:genericSTM32F103RF]
platform = ststm32
board = genericSTM32F103RF

upload_protocol = serial
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

STM32F103RF (96k RAM. 768k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

board = genericSTM32F103V8
```

You can override default STM32F103V8 (20k RAM, 64k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F103V8.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:genericSTM32F103V8]
platform = ststm32
board = genericSTM32F103V8

; change microcontroller
board_build.mcu = stm32f103v8

; change MCU frequency
board_build.f_cpu = 72000000L
```

### Uploading

STM32F103V8 (20k RAM, 64k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```
[env:genericSTM32F103V8]
platform = ststm32
board = genericSTM32F103V8

upload_protocol = serial
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

STM32F103V8 (20k RAM. 64k Flash) does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

Hardware

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

Configuration

Please use genericSTM32F103ZC ID for board option in “platformio.ini” (Project Configuration File):
You can override default STM32F103ZC (48k RAM. 256k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F103ZC.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:genericSTM32F103ZC]
platform = ststm32
board = genericSTM32F103ZC

; change microcontroller
board_build.mcu = stm32f103zct6

; change MCU frequency
board_build.f_cpu = 72000000L
```

### Uploading

STM32F103ZC (48k RAM. 256k Flash) supports the next uploading protocols:

- blackmagic
- cmsis-dap
- dfu
- jlink
- serial
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:genericSTM32F103ZC]
platform = ststm32
board = genericSTM32F103ZC

upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).
STM32F103ZC (48k RAM, 256k Flash) does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

; change MCU frequency
board_build.f_cpu = 84000000L
```

Uploading

STM32F401CB (64k RAM, 128k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:
[env:genericSTM32F401CB]
platform = ststm32
board = genericSTM32F401CB
upload_protocol = serial

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in “platformio.ini” (Project Configuration File).

STM32F401CB (64k RAM, 128k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use `genericSTM32F401CC` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:genericSTM32F401CC]
platform = ststm32
board = genericSTM32F401CC
```

You can override default STM32F401CC (64k RAM. 256k Flash) settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `genericSTM32F401CC.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:genericSTM32F401CC]
platform = ststm32
board = genericSTM32F401CC

; change microcontroller
board_build.mcu = stm32f401cc

; change MCU frequency
board_build.f_cpu = 84000000L
```

Uploading

STM32F401CC (64k RAM. 256k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```
[env:genericSTM32F401CC]
platform = ststm32
board = genericSTM32F401CC
upload_protocol = serial
```

Configuration

Please use `genericSTM32F401RE` ID for `board` option in “platformio.ini” *(Project Configuration File)*:

```
[env:genericSTM32F401RE]
platform = ststm32
board = genericSTM32F401RE
```

You can override default STM32F401RE (96k RAM, 512k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F401RE.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:genericSTM32F401RE]
platform = ststm32
board = genericSTM32F401RE

; change microcontroller
board_build.mcu = stm32f401re

; change MCU frequency
board_build.f_cpu = 84000000L
```

Uploading

STM32F401RE (96k RAM, 512k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:
[env:genericSTM32F401RE]
platform = ststm32
board = genericSTM32F401RE
upload_protocol = serial

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

STM32F401RE (96k RAM, 512k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use `genericSTM32F410RB` ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:genericSTM32F410RB]
platform = ststm32
board = genericSTM32F410RB
```

You can override default STM32F410RB (32k RAM, 128k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F410RB.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:genericSTM32F410RB]
platform = ststm32
board = genericSTM32F410RB

; change microcontroller
board_build.mcu = stm32f410rb

; change MCU frequency
board_build.f_cpu = 100000000L
```

Uploading

STM32F410RB (32k RAM, 128k Flash) supports the next uploading protocols:

- blackmagic
- dfu
PlatformIO Documentation, Release 5.0.5a1

- jlink
- serial
- stlink

Default protocol is serial

You can change upload protocol using `upload_protocol` option:

```
[env:genericSTM32F410RB]
platform = ststm32
board = genericSTM32F410RB
upload_protocol = serial
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

STM32F410RB (32k RAM. 128k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Hardware

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

<table>
<thead>
<tr>

<td>Generic</td>
</tr>
</tbody>
</table>

Configuration

Please use genericSTM32F412RE ID for board option in “platformio.ini” (Project Configuration File):
You can override default STM32F412RE (256k RAM. 512k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F412RE.json`. For example, board_build.mcu, board_build.f_cpu, etc.

```python
[env:genericSTM32F412RE]
platform = ststm32
board = genericSTM32F412RE

; change microcontroller
board_build.mcu = stm32f412re

; change MCU frequency
board_build.f_cpu = 100000000L
```

### Uploading

STM32F412RE (256k RAM. 512k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```python
[env:genericSTM32F412RE]
platform = ststm32
board = genericSTM32F412RE

upload_protocol = serial
```

### Debugging

`Debugging` - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

STM32F412RE (256k RAM. 512k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</tbody>
</table>

**Configuration**

Please use `genericSTM32F415RG` ID for `board` option in “`platformio.ini` (Project Configuration File):

```ini
[env:genericSTM32F415RG]
platform = ststm32
board = genericSTM32F415RG
```

You can override default STM32F415RG (128k RAM, 1024k Flash) settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `genericSTM32F415RG.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:genericSTM32F415RG]
platform = ststm32
board = genericSTM32F415RG

; change microcontroller
board_build.mcu = stm32f415rg

; change MCU frequency
board_build.f_cpu = 168000000L
```

**Uploading**

STM32F415RG (128k RAM, 1024k Flash) supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `serial`

You can change upload protocol using `upload_protocol` option:

```ini
[env:genericSTM32F415RG]
platform = ststm32
board = genericSTM32F415RG

upload_protocol = serial
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.
**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (Project Configuration File).

STM32F415RG (128k RAM. 1024k Flash) does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

**Hardware**

Platform *ST STM32*: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

**Configuration**

Please use *stm32f4stamp* ID for `board` option in “`platformio.ini` (Project Configuration File):

```
[env:stm32f4stamp]
platform = ststm32
board = stm32f4stamp
```

You can override default STM32F4Stamp F405 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest *stm32f4stamp.json*. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:stm32f4stamp]
platform = ststm32
board = stm32f4stamp

; change microcontroller
board_build.mcu = stm32f405rgt6

; change MCU frequency
board_build.f_cpu = 168000000L
```

**Uploading**

STM32F4Stamp F405 supports the next uploading protocols:

- dfu
- jlink
• stlink

Default protocol is dfu

You can change upload protocol using `upload_protocol` option:

```
[env:stm32f4stamp]
platform = stm32
board = stm32f4stamp
upload_protocol = dfu
```

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “`platformio.ini`” (Project Configuration File).

STM32F4Stamp F405 does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

<td>TauLabs</td>
</tr>
</tbody>
</table>

Configuration

Please use `sparky_v1` ID for `board` option in “`platformio.ini` (Project Configuration File):

```
[env:sparky_v1]
platform = ststm32
board = sparky_v1
```

You can override default Sparky V1 F303 settings per build environment using board_*** option, where *** is a JSON object path from board manifest `sparky_v1.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:sparky_v1]
platform = ststm32
board = sparky_v1

; change microcontroller
board_build.mcu = stm32f303cct6

; change MCU frequency
board_build.f_cpu = 72000000L
```

Uploading

Sparky V1 F303 supports the next uploading protocols:
• blackmagic
• cmsis-dap
• jlink
• stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```
[env:sparky_v1]
platform = ststm32
board = sparky_v1

upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

***Warning:*** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Sparky V1 F303 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Hardware

Platform **ST STM32**: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

</tbody>
</table>

Configuration

Please use `thunder_pack ID` for `board` option in “`platformio.ini` (Project Configuration File):”
You can override default ThunderPack v1.0 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `thunder_pack.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:thunder_pack]
platform = ststm32
board = thunder_pack

; change microcontroller
board_build.mcu = stm32l072kz

; change MCU frequency
board_build.f_cpu = 32000000L
```

## Uploading

ThunderPack v1.0 supports the next uploading protocols:

- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:thunder_pack]
platform = ststm32
board = thunder_pack

upload_protocol = stlink
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (*Project Configuration File*).

ThunderPack v1.0 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Wraith V1 ESC

1.12. Boards
PlatformIO Documentation, Release 5.0.5a1

Contents

- Wraith V1 ESC
  - Hardware
  - Configuration
  - Uploading
  - Debugging
  - Frameworks

Hardware

Platform ST STM32: The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

<table>
<thead>
<tr>

<tr>
<td>RAM</td>
<td>7.75KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Airbot</td>
</tr>
</tbody>
</table>

Configuration

Please use wraith32_v1 ID for board option in “platformio.ini” (Project Configuration File):

```plaintext
[env:wraith32_v1]
platform = ststm32
board = wraith32_v1
```

You can override default Wraith V1 ESC settings per build environment using board_*** option, where *** is a JSON object path from board manifest wraith32_v1.json. For example, board_build.mcu, board_build.f_cpu, etc.

```plaintext
[env:wraith32_v1]
platform = ststm32
board = wraith32_v1

; change microcontroller
board_build.mcu = stm32f051k6

; change MCU frequency
board_build.f_cpu = 48000000L
```

Uploading

Wraith V1 ESC supports the next uploading protocols:
- blackmagic
- dfu
- jlink
- serial
- stlink

Default protocol is **stlink**

You can change upload protocol using `upload_protocol` option:

```ini
[env:wraith32_v1]
platform = ststm32
board = wraith32_v1
upload_protocol = stlink
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Wraith V1 ESC does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

  - Frameworks

Hardware

Platform ST STM8: The STM8 is an 8-bit microcontroller family by STMicroelectronics an extended variant of the ST7 microcontroller architecture. STM8 microcontrollers are particularly low cost for a full-featured 8-bit microcontroller.
PlatformIO Documentation, Release 5.0.5a1

### Configuration

Please use `stm8sdisco` ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:stm8sdisco]
platform = ststm8
board = stm8sdisco
```

You can override default ST STM8S-DISCOVERY settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `stm8sdisco.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:stm8sdisco]
platform = ststm8
board = stm8sdisco

; change microcontroller
board_build.mcu = stm8s105c6t6

; change MCU frequency
board_build.f_cpu = 16000000L
```

### Uploading

ST STM8S-DISCOVERY supports the next uploading protocols:

- serial
- stlink
- stlinkv2

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:stm8sdisco]
platform = ststm8
board = stm8sdisco

upload_protocol = stlink
```

### Debugging

Configuration

Please use \texttt{stm8sblue} ID for \textit{board} option in “\texttt{platformio.ini}” (Project Configuration File):

\begin{verbatim}
[env:stm8sblue]
platform = ststm8
board = stm8sblue
\end{verbatim}

You can override default ST STM8S103F3 Breakout Board settings per build environment using \texttt{board_\*\*\*} option, where \*\*\* is a JSON object path from board manifest \texttt{stm8sblue.json}. For example, \texttt{board_build.mcu}, \texttt{board_build.f_cpu}, etc.

\begin{verbatim}
[env:stm8sblue]
platform = ststm8
board = stm8sblue

; change microcontroller
board_build.mcu = stm8s103f3p6

; change MCU frequency
board_build.f_cpu = 16000000L
\end{verbatim}

Uploading

ST STM8S103F3 Breakout Board supports the next uploading protocols:

- serial
- stlinkv2

Default protocol is \texttt{serial}

You can change upload protocol using \textit{upload_protocol} option:

\begin{verbatim}
[env:stm8sblue]
platform = ststm8
board = stm8sblue

upload_protocol = serial
\end{verbatim}

Debugging

\textit{Debugging} currently does not support ST STM8S103F3 Breakout Board board.

### Configuration

Please use `teensy41` ID for `board` option in "platformio.ini" (Project Configuration File):
You can override default Teensy 4.1 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `teensy41.json`. For example, `board_build.mcu, board_build.f_cpu`, etc.

```ini
[env:teensy41]
platform = teensy
board = teensy41

; change microcontroller
board_build.mcu = imxrt1062

; change MCU frequency
board_build.f_cpu = 600000000L
```

### Uploading

Teensy 4.1 supports the next uploading protocols:

- jlink
- teensy-gui

Default protocol is `teensy-gui`

You can change upload protocol using `upload_protocol` option:

```ini
[env:teensy41]
platform = teensy
board = teensy41

upload_protocol = teensy-gui
```

### Debugging

`Debugging` - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

Teensy 4.1 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</table>

Configuration

Please use `teensylc` ID for `board` option in "platformio.ini" (Project Configuration File):

```ini
[env:teensylc]
platform = teensy
board = teensylc
```

You can override default Teensy LC settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `teensylc.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:teensylc]
platform = teensy
board = teensylc
```

(continues on next page)
Uploading

Teensy LC supports the next uploading protocols:

- jlink
- teensy-cli
- teensy-gui

Default protocol is teensy-gui

You can change upload protocol using `upload_protocol` option:

```ini
[env:teensylc]
platform = teensy
board = teensylc
upload_protocol = teensy-gui
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in *“platformio.ini” (Project Configuration File).*

Teensy LC does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

</tr>
</tbody>
</table>

Configuration

Please use teensy2pp ID for board option in “platformio.ini” (Project Configuration File):

```
[env:teensy2pp]
platform = teensy
board = teensy2pp
```

You can override default Teensy++ 2.0 settings per build environment using board_*** option, where *** is a JSON object path from board manifest teensy2pp.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:teensy2pp]
platform = teensy
board = teensy2pp

; change microcontroller
board_build.mcu = at90usb1286

; change MCU frequency
board_build.f_cpu = 16000000L
```
Uploading

Teensy++ 2.0 supports the next uploading protocols:

- teensy-cli
- teensy-gui

Default protocol is teensy-gui

You can change upload protocol using upload_protocol option:

```yaml
[env:teensy2pp]
platform = teensy
board = teensy2pp
upload_protocol = teensy-gui
```

Debugging

*Debugging* currently does not support Teensy++ 2.0 board.

**TI LaunchPad MSP-EXP430G2 w/ MSP430G2231**

**Contents**

- **TI LaunchPad MSP-EXP430G2 w/ MSP430G2231**
  - Hardware
  - Configuration
  - Debugging
  - Frameworks

**Hardware**

Platform **TI MSP430**: MSP430 microcontrollers (MCUs) from Texas Instruments (TI) are 16-bit, RISC-based, mixed-signal processors designed for ultra-low power. These MCUs offer the lowest power consumption and the perfect mix of integrated peripherals for thousands of applications.
### Configuration

Please use `lpmsp430g2231` ID for `board` option in "platformio.ini" (Project Configuration File):

```
[env:lpmsp430g2231]
platform = timsp430
board = lpmsp430g2231
```

You can override default TI LaunchPad MSP-EXP430G2 w/ MSP430G2231 settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `lpmsp430g2231.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:lpmsp430g2231]
platform = timsp430
board = lpmsp430g2231

; change microcontroller
board_build.mcu = msp430g2231

; change MCU frequency
board_build.f_cpu = 1000000L
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in "platformio.ini" (Project Configuration File).

TI LaunchPad MSP-EXP430G2 w/ MSP430G2231 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

### 1.13 Custom Platform & Board

#### 1.13.1 Custom Development Platforms

*PlatformIO* can build the same binary code under different host systems via the single command `pio run` without any dependent software or requirements.

A *manifest* describes how to produce binaries for a particular platform under one or multiple host systems by a set of build scripts, toolchains, the settings for the most popular embedded boards, etc.

This guide explains how to write manifests, to support building for new development platforms.

**Step-by-Step Manual**

1. Choose *Packages* for platform
2. Create *Manifest File platform.json*
3. Create *Build Script main.py*
4. Finish with the *Installation*.

**Contents**

- *Custom Development Platforms*
  - Examples
  - Packages
  - *Manifest File platform.json*
  - *Build Script main.py*
Examples

Please take a look at the source code of existing PlatformIO Development Platforms.

Packages

Some tools are the same when compiling for several platforms, for example a common compiler. A *package* is some tool or framework that can be used when compiling for one or multiple platforms. Even if multiple platforms use the same package, the package only needs to be downloaded once. Since each package is pre-built for the different host systems (Windows, Mac, Linux), developers can get started without first compiling the tools.

PlatformIO has a registry with pre-built packages for the most popular operating systems and you can use them in your platform manifest. Custom packages can be uploaded to the PlatformIO Registry using `pio package publish` command.

Manifest File `platform.json`

Each platform definition includes a *manifest file* with a particular format that is parsed by PlatformIO when handling projects using that platform.

Here is an example `platform.json` for the fictitious platform “myplatform”:

```json
{
  "name": "myplatform",
  "title": "My Platform",
  "description": "My custom development platform",
  "homepage": "https://mycompany.com",
  "license": "Apache-2.0",
  "keywords": ["keyword_1", "keyword_N"],

**Build Script `main.py`**

Each platform definition must include a `main.py`.

PlatformIO’s build script is based on a next-generation build tool named SCons. PlatformIO has its own built-in firmware builder `env.BuildProgram` with deep library search. Please see the following template as start for developing your own `main.py`.

```python
"""
    Build script for test.py
test-builder.py
"""

from os.path import join
from SCons.Script import AlwaysBuild, Builder, Default, DefaultEnvironment

env = DefaultEnvironment()

# A full list with the available variables
# http://www.scons.org/doc/production/HTML/scons-user.html#app-variables
env.Replace(
    AR="ar",
    AS="gcc",
    CC="gcc",
    CXX="g++",
    OBJCOPY="objcopy",
    RANLIB="ranlib",
    
    UPLOADER=join("$PIOPACKAGES_DIR", "tool-bar", "uploader"),
    UPLOADCMD="$UPLOADER $SOURCES"
)

env.Append(
    ARFLAGS=["..."],
    
(continues on next page)```
platformio documentation, release 5.0.5a1

(continued from previous page)

```
ASFLAGS=['flag1', 'flag2', 'flagN'],
CCFLAGS=['flag1', 'flag2', 'flagN'],
CXXFLAGS=['flag1', 'flag2', 'flagN'],
LINKFLAGS=['flag1', 'flag2', 'flagN'],
CPPDEFINES=['DEFINE_1', 'DEFINE=2', 'DEFINE_N'],
LIBS=['additional', 'libs', 'here'],

BUILDERS=dict(
    ElfToBin=Builder(
        action=''.join(['$OBJCOPY', '-O', 'binary', '$SOURCES', '$TARGET']),
        suffix='.bin',
    ),
)

# The source code of "platformio-build-tool" is here
# https://github.com/platformio/platformio-core/blob/develop/platformio/builder/tools/
# →platformio.py

# # Target: Build executable and linkable firmware
# target_elf = env.BuildProgram()

# # Target: Build the .bin file
# target_bin = env.ElfToBin(join('$BUILD_DIR', 'firmware'), target_elf)

# # Target: Upload firmware
# upload = env.Alias(['upload'], target_bin, '$UPLOADCMD')
# AlwaysBuild(upload)

# # Target: Define targets
# Default(target_bin)
```

Installation

Using the “myplatform” platform example above:

1. Create a `platforms` directory in `core_dir` if it doesn’t exist.
2. Create a `myplatform` directory in `platforms`
3. Copy the `platform.json` and `builder/main.py` files to the `myplatform` directory.
4. Search the available platforms via the `pio platform search` command. You should see the new `myplatform` platform.

5. Install the `myplatform` platform via the `pio platform install` command.

Now, you can use `myplatform` as value for the `platform` option in “platformio.ini” (Project Configuration File).

Publishing

You can publish a development platform to the PlatformIO Trusted Registry using `pio package publish` command. Other developers will be able to install it. Every time when you modify a source code of a development platform you will need to increment the “version” field in “platform.json” manifest and re-publish again.

If the published development platform has an issue and you would like to remove it from the PlatformIO Trusted Registry, please use `pio package unpublish` command.

1.13.2 Custom Embedded Boards

PlatformIO has pre-built settings for many popular embedded boards. The list of these boards is available as a web page at PlatformIO Boards Explorer or through the CLI command `pio boards`.

Custom boards can also be defined from scratch or by overriding settings of existing boards. All data is declared using the JSON syntax via associative array name/value pairs.

### Contents

- Custom Embedded Boards
  - JSON Structure
  - Installation
  - Examples

### JSON Structure

The key fields are:

- **build** data is handed over to the *Development Platforms* and *Frameworks* builders
- **frameworks** is the list with supported *Frameworks*. Each working environment for each project that uses the board will choose one of the frameworks declared here.
- **platform** name of *Development Platforms*
- **upload** upload settings which depend on the **platform**

For details, see existing boards as examples, available under `.platformio/platforms/*/boards/`

```json
{
  "build": {
    "extra_flags": "-DHELLO_PLATFORMIO",
    "f_cpu": "16000000L",
    "hwids": [
      "0x1234",
      "0x5678",
      "0x9ABC"
    ]
  }
}
```

(continues on next page)
Installation

1. Create `boards` directory in `core_dir` if it doesn’t exist.
2. Create `myboard.json` file in this `boards` directory.
3. Search available boards via `pio boards` command. You should see `myboard` board.

Now, you can use `myboard` for the `board` option in “`platformio.ini`” (Project Configuration File).

Note: You can have custom boards per project. In this case, please put your board’s JSON files to `boards_dir`.

Examples

Please take a look at the source code of PlatformIO Development Platforms and navigate to `boards` folder of the repository.

1.14 Debugging

It Simply Works. Easier than ever before!
PlatformIO Debugging Solution offers a unique debugging experience for productive embedded development. Using our multi-board and multi-architecture programming experience, we simplified the debugging process in the same way. A zero debugging configuration with support for the most popular debugging probes and compatibility between IDEs and OS.

Developers can finally forget about complex UI windows which they need to pre-configure before a simple “Hello World!” debugging session. No need to know any aspects about the debugging server or how to configure it. PIO Unified Debugger does this complex work automatically having a rich configuration database per each board and debugging probe.

Just select a board, connect debugging probe (if a board does not have onboard debugging interface), specify it in PlatformIO project configuration file “platformio.ini”, and a project is ready for 1-Click debugging.

- “1-click” solution, zero configuration
- Support over 300+ embedded boards (see below)
- Multiple architectures and development platforms
- Windows, MacOS, Linux
- Built-in into PlatformIO IDE for Atom and VSCode
- Integration with Eclipse and Sublime Text

Hint: In our experience, VSCode has the best system performance, modern interface for PlatformIO Debugging Solution, and users have found it easier to get started. Key debugging features of VSCode:

- Local, Global, and Static Variable Explorer
- Conditional Breakpoints
- Expressions and Watchpoints
- Generic Registers
- Peripheral Registers
- Memory Viewer
- Disassembly
- Multi-thread support
- A hot restart of an active debugging session
1.14.1 Tutorials

- Arduino and Nordic nRF52-DK: debugging and unit testing
- Zephyr and Nordic nRF52-DK: debugging, unit testing, project analysis
- STM32Cube HAL and Nucleo-F401RE: debugging and unit testing
1.14.2 Configuration

PlatformIO Debugging Solution can be configured using "platformio.ini" (Project Configuration File):

1.14.3 Tools & Debug Probes

You can switch between debugging tools using debug_tool option.

**Warning:** You will need to install debug tool drivers depending on your operating system. Please check “Drivers” section for debugging tool below.

**Altera / Intel USB-Blaster**

USB Blaster Download Cable is designed for ALTERA FPGA, CPLD, Active Serial Configuration Devices and Enhanced Configuration Devices, USB 2.0 connection to the PC and JTAG, AS, PS to the target device. Official reference can be found here.
If you would like to use this tool for firmware uploading, please change upload protocol:

```python
[env:myenv]
platform = ...
board = ...
debug_tool = altera-usb-blaster
upload_protocol = altera-usb-blaster
```

More options:

- [Debugging options](#)
- [Upload options](#)

**Drivers**

Please install official drivers.

Atmel-ICE

Atmel-ICE is a powerful development tool for debugging and programming ARM® Cortex®-M based SAM and AVR microcontrollers with on-chip debug capability. Official reference can be found here.

Contents

- Configuration
- Drivers
- Platforms
- Frameworks
- Boards

Configuration

You can configure debugging tool using `debug_tool` option in `platformio.ini` (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
debg_tool = atmel-ice
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```ini
[env:myenv]
platform = ...
board = ...
debg_tool = atmel-ice
upload_protocol = atmel-ice
```

More options:

- Debugging options
- Upload options
Drivers

**Windows** When installing the Atmel-ICE on a computer running Microsoft Windows, the USB driver is loaded when the Atmel-ICE is first plugged in.

**Mac** Not required.

**Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

avr-stub

avr-stub is a source level debugger based on GDB stub mechanism. It works with ATmega328 and Arduino Mega microcontrollers without an external programmer. The official reference can be found here.

Contents

- Configuration
- Breakpoint modes
- Debugger limitations
- Platforms
- Frameworks
- Boards

Configuration

In a nutshell, avr-stub is a piece of software (stub) that is added to your application and communicates with PlatformIO when a debug session is running. It requires several additional configuration steps in order to use it as a debug tool. To use avr-stub, the following settings in "platformio.ini" (Project Configuration File):

```ini
[env:myenv]
platform = atmelavr
board = ...
devp工具 = avr-stub
devp_port = SERIAL_PORT
```

(continues on next page)
lib_deps =
jdolinay/avr-debugger @ ~1.1

Where the value in `debug_port` is a serial port connected to your board and `jdolinay/avr-debugger` is a special library that implements the GDB stub.

In order to enable the GDB stub in your application, a call to the special function `debug_init` must be added at the beginning of your application. For example, with the Arduino framework it might look like this:

```
#include "Arduino.h"
#include "avr8-stub.h"

void setup()
{
    // initialize GDB stub
    debug_init();
    pinMode(LED_BUILTIN, OUTPUT);
}

void loop()
{
    digitalWrite(LED_BUILTIN, HIGH);
    delay(1000);
    digitalWrite(LED_BUILTIN, LOW);
    delay(1000);
}
```

**Warning:** If your program doesn’t stop on a breakpoint, try specifying an explicit breakpoint directly in the code using the `breakpoint` function:

```
... 
void loop()
{
    breakpoint();
    digitalWrite(LED_BUILTIN, HIGH);
    delay(300);
    digitalWrite(LED_BUILTIN, LOW);
    delay(100);
}
... 
```

**Breakpoint modes**

The `avr-stub` tool supports the following three breakpoint modes:
AVR8_BREAKPOINT_MODE

<table>
<thead>
<tr>
<th>Description</th>
<th>AVR8_BREAKPOINT_MODE</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLASH breakpoint mode, which works only with atmega328 based boards and requires a special bootloader</td>
<td>0</td>
</tr>
<tr>
<td>RAM breakpoint mode, the default mode which works out of the box with all atmega328, atmega1280, and atmega2560 based boards</td>
<td>1</td>
</tr>
<tr>
<td>FLASH breakpoint mode through Optiboot, which works with all atmega328, atmega1280, and atmega2560 based boards and requires the version 8 of the bootloader.</td>
<td>2</td>
</tr>
</tbody>
</table>

To switch between modes, specify a special macro definition `AVR8_BREAKPOINT_MODE` with the appropriate value from the table above, for example:

```
[env:myenv]
platform = atmelavr
board = uno

; Set breakpoint mode
build_flags =
  -DAVR8_BREAKPOINT_MODE=2

debug_tool = avr-stub
debug_port = SERIAL_PORT

lib_deps =
  jdolinay/avr-debugger @ ~1.1
```

**Debugger limitations**

- One external interrupt pin must be reserved for the debugger.
- Any part of your application that uses the UART module (e.g. Arduino Serial class) cannot be used in your program together with the debugger.
- When using flash breakpoints the watchdog cannot be used.

More detailed information can be found in the Important limitations of the debugger section in the official documentation.

**Platforms**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atmel AVR</td>
<td>Atmel AVR 8-bit MCUs deliver a unique combination of performance, power efficiency and design flexibility. Optimized to speed time to market-and easily adapt to new ones-they are based on the industry’s most code-efficient architecture for C and assembly programming</td>
</tr>

**Black Magic Probe**

The Black Magic Probe is a modern, in-application debugging tool for embedded microprocessors. It is able to control and examine the state of the target microprocessor using a JTAG or Serial Wire Debugging (SWD) port and on-chip debug logic provided by the microprocessor. The probe connects to a host computer using a standard USB interface. Official reference can be found here.

Also, see Custom debugging configuration with Black Magic Probe.

**Contents**

- Configuration
- Drivers
- Wiring Connections
  - JTAG Interface
  - Serial Wire Mode Interface (SWD)
- Platforms
- Frameworks

1.14. Debugging
You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
depth_tool = blackmagic
depth_port = <CONFIGURE GDB PORT>

; Debug Port Examples
;

; Linux
depth_port = /dev/ttyACM0

; Windows for COM1-COM9
depth_port = COM3

; Windows for COM10-XXX
depth_port = \\.\COM13

; macOS
depth_port = /dev/cu.usbmodemE2C0C4C6
```

Black Magic Probe has 2 serial ports: UART and GDB. We will need “GDB” port. Please use `PlatformIO Home` > Devices or `PlatformIO Core (CLI)` and `pio device list` command to list available ports. If you do not see “Black Magic Probe GDB” port, please try both. More details.

If you would like to use this tool for firmware uploading, please change upload protocol:

```ini
[env:myenv]
platform = ...
board = ...
depth_tool = blackmagic
depth_port = <CONFIGURE GDB PORT>

upload_port = <THE SAME AS DEBUG PORT>

; SWD interface
upload_protocol = blackmagic

; JTAG interface
upload_protocol = blackmagic-jtag
```

More options:

<tr>
<td><strong>Aceinna IMU</strong></td>
<td>Open-source, embedded development platform for Aceinna IMU hardware. Run custom algorithms and navigation code on Aceinna IMU/INS hardware.</td>
</tr>
<tr>
<td><strong>Atmel SAM</strong></td>
<td>Atmel</td>
</tr>
<tr>
<td><strong>Freescale Kinetis</strong></td>
<td>Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.</td>
</tr>
<tr>
<td><strong>Nordic nRF51</strong></td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.</td>
</tr>
<tr>
<td><strong>Nordic nRF52</strong></td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td><strong>NXP i.MX RT</strong></td>
<td>The i.MX RT series of crossover processors features the Arm Cortex-M core, real-time functionality and MCU usability at a cost-effective price.</td>
</tr>
<tr>
<td><strong>NXP LPC</strong></td>
<td>The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.</td>
</tr>
<tr>
<td><strong>Silicon Labs EFM32</strong></td>
<td>Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to 48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features innovative low energy techniques, short wake-up time from energy saving modes and a wide selection of peripherals, making it ideal for battery operated applications and other systems requiring high performance and low-energy consumption.</td>
</tr>
<tr>
<td><strong>ST STM32</strong></td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>

</table>
## Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences.</td>
</tr>
<tr>
<td>CMSIS</td>
<td>The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software reuse, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices.</td>
</tr>
<tr>
<td>Mbed</td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices.</td>
</tr>
<tr>
<td>STM32Cube</td>
<td>STM32Cube embedded software libraries, including: The HAL hardware abstraction layer, enabling portability between different STM32 devices via standardized API calls; The Low-Layer (LL) APIs, a light-weight, optimized, expert oriented set of APIs designed for both performance and runtime efficiency.</td>
</tr>
<tr>
<td>Simba</td>
<td>Simba is an RTOS and build framework with aims to make embedded programming easy and portable.</td>
</tr>
<tr>
<td>ST Standard Peripheral Library</td>
<td>The ST Standard Peripheral Library provides a set of functions for handling the peripherals on the STM32 family of microcontrollers.</td>
</tr>
<tr>
<td>Zephyr RTOS</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind.</td>
</tr>
<tr>
<td>libopenCM3</td>
<td>The libOpenCM3 framework aims to create a free and open-source firmware library for various ARM Cortex-M0(+)/M3/M4 microcontrollers, including ST STM32, Ti Tiva and Stellaris, NXP LPC, Atmel SAM3, Energy Micro EFM32 and others.</td>
</tr>
</tbody>

**CMSIS-DAP**

CMSIS-DAP is generally implemented as an on-board interface chip, providing direct USB connection from a development board to a debugger running on a host computer on one side, and over JTAG (Joint Test Action Group) or SWD (Serial Wire Debug) to the target device to access the Coresight DAP on the other. Official reference can be found [here](#).
**Configuration**

You can configure debugging tool using `debug_tool` option in `platformio.ini` *(Project Configuration File)*:

```
[env:myenv]
platform = ...
board = ...
debug_tool = cmsis-dap
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debug_tool = cmsis-dap
upload_protocol = cmsis-dap
```

More options:

- *Debugging options*
- *Upload options*

**Drivers**

**Windows**  Please install *Windows serial driver* and check “USB Driver Installation” guide for your board.

**Mac**  Not required.

**Linux**  Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.
### Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atmel SAM</td>
<td>Atmel</td>
</tr>
<tr>
<td>Freescale Kinetis</td>
<td>Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.</td>
</tr>
<tr>
<td>Maxim 32</td>
<td>Maxim’s microcontrollers provide low-power, efficient, and secure solutions for challenging embedded applications. Maxim’s processors embed cutting-edge technologies to secure data and intellectual property, proven analog circuitry for real-world applications, and battery-conserving low power operation.</td>
</tr>
<tr>
<td>Nordic nRF51</td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.</td>
</tr>
<tr>
<td>Nordic nRF52</td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td>NXP LPC</td>
<td>The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.</td>
</tr>
<tr>
<td>ST STM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
<tr>
<td>WIZ-Net W7500</td>
<td>The IOP (Internet Offload Processor) W7500 is the one-chip solution which integrates an ARM Cortex-M0, 128KB Flash and hardwired TCP/IP core for various embedded application platform especially requiring Internet of things.</td>
</tr>
</tbody>
</table>
Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td>CMSIS</td>
<td>The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software re-use, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices</td>
</tr>
<tr>
<td>Mbed</td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices</td>
</tr>
<tr>
<td>STM32Cube</td>
<td>STM32Cube embedded software libraries, including: The HAL hardware abstraction layer, enabling portability between different STM32 devices via standardized API calls; The Low-Layer (LL) APIs, a light-weight, optimized, expert oriented set of APIs designed for both performance and runtime efficiency</td>
</tr>
<tr>
<td>Simba</td>
<td>Simba is an RTOS and build framework with aims to make embedded programming easy and portable</td>
</tr>
<tr>
<td>Standard Peripheral Library</td>
<td>The ST Standard Peripheral Library provides a set of functions for handling the peripherals on the STM32 family of microcontrollers.</td>
</tr>
<tr>
<td>Zephyr RTOS</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>
<tr>
<td>libopencm3</td>
<td>The libOpenCM3 framework aims to create a free and open-source firmware library for various ARM Cortex-M0(+)M3/M4 microcontrollers, including ST STM32, Ti Tiva and Stellaris, NXP LPC, Atmel SAM3, Energy Micro EFM32 and others</td>
</tr>
</tbody>

ESP-Prog

ESP-Prog is one of Espressif’s development and debugging tools, with functions including automatic firmware downloading, serial communication, and JTAG online debugging. ESP-Prog’s automatic firmware downloading and serial communication functions are supported on both the ESP8266 and ESP32 platforms, while the JTAG online debugging is supported only on the ESP32 platform. Official reference can be found here.

GD-LINK

GD-Link adapter is a three-in-one multi-function development tool for GD32 series of MCUs. It provides CMSIS-DAP debugger port with JTAG/SWD interface. Official reference can be found [here](#).

**Contents**

- Configuration
- Drivers
- Wiring Connections
  - JTAG Interface
  - Serial Wire Mode Interface (SWD)
Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
debug_tool = gd-link
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debug_tool = gd-link
upload_protocol = gd-link
```

More options:

- **Debugging options**
- **Upload options**

Drivers

- **Windows** Check vendor recommendations.
- **Mac** Not required.
- **Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

Wiring Connections

**JTAG Interface**

Boards

Note: For more detailed board information please scroll tables below by horizontal.
### oddWires IOT-Bus JTAG

This IoT-Bus module provides JTAG debugging for the oddWires IoT-Bus Io and oddWires IoT-Bus Proteus boards (can be used with other boards too, see wiring connections below). The board uses the FT232H to provide a USB controller with JTAG support. Both debugging and flashing is possible using this port. Official reference can be found here.
Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```yaml
[env:myenv]
platform = ...
board = ...
debug_tool = iot-bus-jtag
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```yaml
[env:myenv]
platform = ...
board = ...
debug_tool = iot-bus-jtag
upload_protocol = iot-bus-jtag
```

More options:

- [Debugging options](#)
- [Upload options](#)

Drivers

**Windows**

- Step-by-step guide: Drivers, Zadig, Wiring
- Video tutorial

**Mac** macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

**Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

J-LINK

SEGGER J-Links are the most widely used line of debug probes available today. They’ve proven their value for more than 10 years with over 400,000 units sold, including OEM versions and on-board solutions. This popularity stems from the unparalleled performance, extensive feature set, large number of supported CPUs, and compatibility with all popular development environments. Official reference can be found here.

- J-Link Supported Devices

Also, see Custom debugging configuration with J-Link GDB Server.

Contents

- Configuration
  - Custom Server
- Drivers
- Wiring Connections
  - JTAG Interface
  - Serial Wire Mode Interface (SWD)
- Platforms
- Frameworks
- Boards

Configuration

You can configure debugging tool using debug_tool option in “platformio.ini” (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
debug_tool = jlink
```

If you would like to use this tool for firmware uploading, please change upload protocol:
```yaml
[env:myenv]
platform = ...
board = ...
debug_tool = jlink

; SWD interface
upload_protocol = jlink

; JTAG interface
upload_protocol = jlink-jtag

More options:

- **Debugging options**
- **Upload options**

**Custom Server**

```yaml
[env:debug_jlink]
platform = ststm32
framework = mbed
board = nucleo_f446re
debug_tool = jlink
debug_port = :2331
debug_server = /full/path/to/JLinkGDBServerCL
-singlerun
-if
SWD
-select
USB
-port
2331
-device
STM32F446RE
```

**Drivers**

**Windows**

1. Start debugging session using *PlatformIO IDE*. PlatformIO will install J-Link software dependencies
2. Navigate to `core_dir/packages/tool-jlink/USBDriver`
3. Run `InstDrivers.exe`

**Mac**  Not required.

**Linux**  Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

<tr>
<td>Espressif 32</td>
<td>Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.</td>
</tr>
<tr>
<td>Freescale Kinetis</td>
<td>Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.</td>
</tr>
<tr>
<td>GigaDevice GD32V</td>
<td>The GigaDevice GD32V device is a 32-bit general-purpose microcontroller based on the RISC-V core with an impressive balance of processing power, reduced power consumption and peripheral set.</td>
</tr>
<tr>
<td>Infineon XMC</td>
<td>Infineon has designed the XMC microcontrollers for real-time critical applications with an industry-standard core. The XMC microcontrollers can be integrated with the Arduino platform</td>
</tr>
<tr>
<td>Kendryte K210</td>
<td>Kendryte K210 is an AI capable RISCV64 dual core SoC.</td>
</tr>
<tr>
<td>Maxim 32</td>
<td>Maxim’s microcontrollers provide low-power, efficient, and secure solutions for challenging embedded applications. Maxim’s processors embed cutting-edge technologies to secure data and intellectual property, proven analog circuitry for real-world applications, and battery-conserving low power operation.</td>
</tr>
<tr>
<td>Nordic nRF51</td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.</td>
</tr>
<tr>
<td>Nordic nRF52</td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td>Nuclei</td>
<td>Find professional RISC-V Processor IP in Nuclei, first professional RISC-V IP company in Mainland China, match all your requirements in AIoT Era.</td>
</tr>
<tr>
<td>NXP i.MX RT</td>
<td>The i.MX RT series of crossover processors features the Arm Cortex-M core, real-time functionality and MCU usability at a cost-effective price.</td>
</tr>
<tr>
<td>NXP LPC</td>
<td>The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.</td>
</tr>
<tr>
<td>Shakti</td>
<td>Shakti is an open-source initiative by the RISE group at IIT-Madras, which is not only building open source, production grade processors, but also associated components like interconnect fabrics, verification tools, storage controllers, peripheral IPs and SOC tools.</td>
</tr>
<tr>
<td>SiFive</td>
<td>SiFive brings the power of open source and software automation to the semiconductor industry, making it possible to develop new hardware faster and more affordably than ever before.</td>
</tr>
<tr>
<td>Silicon Labs EFM32 Gecko</td>
<td>Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to 48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features innovative low energy techniques, short wake-up time from energy saving modes and a wide selection of peripherals, making it ideal for battery operated applications and other systems requiring high performance and low-energy consumption.</td>
</tr>
<tr>
<td>STM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
<tr>
<td>Teensy</td>
<td>Teensy is a complete USB-based microcontroller development system, in a very small footprint, capable of implementing many types of projects. All programming is done via the USB port. No special programmer is needed, only a standard USB cable and a PC or Macintosh with a USB port.</td>
</tr>
</tbody>
</table>
# Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td>CMSIS</td>
<td>The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software re-use, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices</td>
</tr>
<tr>
<td>ESPressif IoT Development Framework</td>
<td>ESP-IDF is the official development framework for the ESP32 and ESP32-S Series SoCs.</td>
</tr>
<tr>
<td>FreeRTOS</td>
<td>FreeRTOS is a real-time operating system kernel for embedded devices that has been ported to 40 microcontroller platforms</td>
</tr>
<tr>
<td>Freedom E SDK</td>
<td>Open Source Software for Developing on the SiFive Freedom E Platform</td>
</tr>
<tr>
<td>GigaDevice GD32VF103 SDK</td>
<td>GigaDevice GD32VF103 Firmware Library (SDK) is a firmware function package, including programs, data structures and macro definitions, all the performance features of peripherals of GD32VF103 devices are involved in the package</td>
</tr>
<tr>
<td>Kendryte FreeRTOS SDK</td>
<td>Kendryte SDK with FreeRTOS support</td>
</tr>
<tr>
<td>Kendryte Standalone SDK</td>
<td>Kendryte Standalone SDK without OS support</td>
</tr>
<tr>
<td>Mbed</td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices</td>
</tr>
<tr>
<td>Nuclei SDK</td>
<td>Open Source Software Development Kit for the Nuclei N/NX processors</td>
</tr>
<tr>
<td>STM32Cube</td>
<td>STM32Cube embedded software libraries, including: The HAL hardware abstraction layer, enabling portability between different STM32 devices via standardized API calls; The Low-Layer (LL) APIs, a light-weight, optimized, expert oriented set of APIs designed for both performance and runtime efficiency</td>
</tr>
<tr>
<td>Shakti SDK</td>
<td>A software development kit for developing applications on Shakti class of processors</td>
</tr>
<tr>
<td>Simba</td>
<td>Simba is an RTOS and build framework with aims to make embedded programming easy and portable</td>
</tr>
<tr>
<td>Standard Peripheral Library</td>
<td>The ST Standard Peripheral Library provides a set of functions for handling the peripherals on the STM32 family of microcontrollers.</td>
</tr>
<tr>
<td>Zephyr</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind.</td>
</tr>
<tr>
<td>libopencm3</td>
<td>The libOpenCM3 framework aims to create a free and open-source firmware library for various ARM Cortex-M0(+)/M3/M4 microcontrollers, including ST STM32, Ti Tiva and Stellaris, NXP LPC, Atmel SAM3, Energy Micro EFM32 and others</td>
</tr>
</tbody>
</table>

Mini-Module FT2232H

The FT2232H Mini Module is a USB to dual channel serial/MPSS/FIFO interface converter module based on the FT2232H USB Hi-Speed IC. The FT2232H handles all the USB signalling and protocol handling. The module provides access to device I/O interfaces via 2 double row 0.1” pitch male connectors. The module is ideal for development purposes to quickly prove functionality of adding USB to a target design. Official reference can be found here

Configuration

You can configure debugging tool using `debug_tool` option in "platformio.ini" (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
debug_tool = minimodule
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debug_tool = minimodule
upload_protocol = minimodule
```

More options:
PlatformIO Documentation, Release 5.0.5a1

- Debugging options
- Upload options

Drivers

Windows

- Step-by-step guide: Drivers, Zadig, Wiring
- Video tutorial

Mac macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

Linux Please install “udev” rules 99-platformio-udev.rules. If you already installed them before, please check that your rules are up-to-date or repeat steps.

Wiring Connections

**MSP Debug**

The MSP debug stack (MSPDS) for all MSP430™ microcontrollers (MCUs) and SimpleLink™ MSP432™ devices consists of a static library on the host system side as well as an embedded firmware that runs on debug tools including the MSP-FET, MSP-FET430UIF or on-board eZ debuggers. It is the bridging element between all PC software and all MSP430 and SimpleLink MSP432 microcontroller derivatives and handles tasks such as code download, stepping through code or break points. Official reference can be found [here](#).
Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
debug_tool = mspdebug
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debug_tool = mspdebug
upload_protocol = mspdebug
```

More options:

- **Debugging options**
- **Upload options**

Drivers

**Windows** Please “USB Driver Installation” guide for your board.

**Mac** Not required.

**Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

Olimex ARM-USB-OCD

3-IN-1 fast USB ARM/ESP32 JTAG, USB-to-RS232 virtual port and power supply 5-9-12VDC device (supported by OpenOCD ARM debugger software). Official reference can be found [here](#).

Contents

- Configuration
- Drivers
- Wiring Connections
- Platforms
- Frameworks
- Boards

Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
debug_tool = olimex-arm-usb-ocd
```

If you would like to use this tool for firmware uploading, please change upload protocol:
More options:

- **Debugging options**
- **Upload options**

### Drivers

**Windows**

- Step-by-step guide: Drivers, Zadig, Wiring
- Video tutorial

**Mac** macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

**Linux** Please install “udev” rules 99-platformio-udev.rules. If you already installed them before, please check that your rules are up-to-date or repeat steps.

Olimex ARM-USB-TINY-H

Low-cost and high-speed ARM/ESP32 USB JTAG. Official reference can be found here.

Contents

- Configuration
- Drivers
- Wiring Connections
- Platforms
- Frameworks
- Boards

Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):
If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debug_tool = olimex-arm-usb-tiny-h

upload_protocol = olimex-arm-usb-tiny-h
```

More options:

- *Debugging options*
- *Upload options*

**Drivers**

**Windows**

- Step-by-step guide: Drivers, Zadig, Wiring
- Video tutorial

**Mac** macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

**Linux** Please install “udev” rules *99-platformio-udev.rules*. If you already installed them before, please check that your rules are up-to-date or repeat steps.

**Wiring Connections**

![Wiring Diagram]
### Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIPS Alliance</td>
<td>The CHIPS Alliance develops high-quality, open source hardware designs relevant to silicon devices and FPGAs.</td>
</tr>
<tr>
<td>Espressif 32</td>
<td>Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.</td>
</tr>
<tr>
<td>Kendryte K210</td>
<td>Kendryte K210 is an AI capable RISCV64 dual core SoC.</td>
</tr>
<tr>
<td>SiFive</td>
<td>SiFive brings the power of open source and software automation to the semiconductor industry, making it possible to develop new hardware faster and more affordably than ever before.</td>
</tr>
</tbody>
</table>

### Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td>ESP-IDF</td>
<td>ESP-IDF is the official development framework for the ESP32 and ESP32-S Series SoCs.</td>
</tr>
<tr>
<td>FreeRTOS</td>
<td>FreeRTOS is a real-time operating system kernel for embedded devices that has been ported to 40 microcontroller platforms</td>
</tr>
<tr>
<td>Freedom E SDK</td>
<td>Open Source Software for Developing on the SiFive Freedom E Platform</td>
</tr>
<tr>
<td>Kendryte FreeRTOS SDK</td>
<td>Kendryte SDK with FreeRTOS support</td>
</tr>
<tr>
<td>Kendryte Standalone SDK</td>
<td>Kendryte Standalone SDK without OS support</td>
</tr>
<tr>
<td>Simba</td>
<td>Simba is an RTOS and build framework with aims to make embedded programming easy and portable</td>
</tr>
<tr>
<td>WD-Firmware</td>
<td>The WD Firmware package contains firmware applications and Processor Support Package (PSP) for various cores, alongside demos which support all features</td>
</tr>
<tr>
<td>Zephyr RTOS</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>

**Drivers**

**Windows**
- Step-by-step guide: Drivers, Zadig, Wiring
- Video tutorial

**Mac** macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

**Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

**Wiring Connections**

![Wiring Diagram](image-url)
Olimex ARM-USB-TINY 20-Pin Connector | Board JTAG Pin | Description
--- | --- | ---
1 | VCC | Positive Supply Voltage — Power supply for JTAG interface drivers
4 | GND | Digital ground
5 | TDI | Test Data In pin
7 | TMS | Test Mode State pin
9 | TCK | JTAG Return Test Clock
13 | TDO | Test Data Out pin
3 | RESET | Connect this pin to the (active low) reset input of the target CPU (EN for ESP32)

Renode

Renode is a development framework which accelerates IoT and embedded systems development by letting you simulate physical hardware systems - including both the CPU, peripherals, sensors, environment and wired or wireless medium between nodes. For more information, see Renode’s official website.

Contents

- Configuration
- Installation
- Custom Settings
  - Additional Analyzers
  - Redirecting peripherals output
- Examples
### Configuration

You can configure Renode as a debugging tool using `debug_tool` option in "platformio.ini" (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
debug_tool = renode
```

More options:

- [Debugging options](#)

### Installation

We will automatically install for you the latest Renode package using PlatformIO package manager. The only requirement is to install Mono/.NET framework.

- **Windows**  On Windows 7, download and install .NET Framework 4.7. Windows 10 ships with .NET by default, so no action is required there.
- **Mac**    Install Homebrew and the `mono` package using `brew install mono`.
- **Linux**  Install the `mono-complete` package as per the installation instructions for various Linux distributions which can be found on the Mono project website.

Check the [official Renode installation guide](#) for more details.

### Custom Settings

If the default Renode configuration is not suitable for your project, it’s possible to override the default Renode flags in "platformio.ini" (Project Configuration File). The following sections describe typical use cases where custom settings might be useful.

### Additional Analyzers

Additional analyzers might be handy in cases when an application prints output to a peripheral which is not visible by default. For example, to open an additional UART window while using Renode as the upload tool, a special command `showAnalyzer` should be added to `upload_flags` option, e.g.:

```ini
[env:hifive1-revb]
platform = sifive
framework = zephyr
board = hifive1-revb
; Override the default upload settings
upload_command = renode $UPLOAD_FLAGS
```

(continues on next page)
upload_flags =
    -e include @scripts/single-node/sifive_fe310.resc
    -e showAnalyzer uart1
    -e sysbus LoadELF @$SOURCE
    -e start

Redirecting peripherals output

It might be useful to redirect output from device peripherals to a more convenient communication channel. A typical example is redirecting UART output to a socket which can be opened by `pio device monitor` while using Renode as the debug tool. The default debug flags can be overridden using the `debug_server` option. For example, the following configuration can be used to redirect output from the UART0 port on the hifive1-revb board:

```plaintext
[env:hifive1-revb]
platform = sifive
framework = zephyr
board = hifive1-revb
; Override the default debug settings
debug_tool = custom
debug_port = localhost:3333
debug_server = renode
  --hide-log
  -e machine StartGdbServer 3333 True
  -e emulation CreateServerSocketTerminal 4321 "externalUART" false
  -e connector Connect uart0 externalUART
debug_extra_cmds =
    monitor start

# Monitor port for Renode integration
monitor_port = socket://localhost:4321
```

RV-LINK

RISC-V emulator implemented with RISC-V development board. Unlike other emulators: RV-LINK interacts directly with GDB via a USB serial port and does not require an intermediary such as OpenOCD. Official reference can be found here.

**Sipeed RV Debugger**
High-speed 3-IN-1 fast USB ARM/ESP32 JTAG, USB-to-RS232 virtual port and power supply 5VDC device. Official reference can be found here.

### Contents

- Configuration
- Drivers
- Wiring Connections
- Platforms
- Frameworks
- Boards

### Configuration

You can configure debugging tool using `debug_tool` option in “`platformio.ini` (Project Configuration File)“:

```
[env:myenv]
platform = ...
board = ...
debbug_tool = sipeed-rv-debugger
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debbug_tool = sipeed-rv-debugger
upload_protocol = sipeed-rv-debugger
```

More options:

- Debugging options
- Upload options

### Drivers

**Windows**

- Step-by-step guide: Drivers, Zadig, Wiring
- Video tutorial

**Mac** macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

**Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

**ST-LINK**

The ST-LINK is an in-circuit debugger and programmer for the STM8 and STM32 microcontroller families. The single wire interface module (SWIM) and JTAG/serial wire debugging (SWD) interfaces are used to communicate with any STM8 or STM32 microcontroller located on an application board. Official reference can be found here.

  - JTAG Interface
– Serial Wire Mode Interface (SWD)

• Platforms
• Frameworks
• Boards

### Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
debug_tool = stlink
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```ini
[env:myenv]
platform = ...
board = ...
debug_tool = stlink
upload_protocol = stlink
```

More options:

• Debugging options
• Upload options

### Drivers

**Windows** Please install official ST-LINK USB driver.

**Mac** Not required.

**Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

**TI-ICDI**

Tiva™ C Series evaluation and reference design kits provide an integrated In-Circuit Debug Interface (ICDI) which allows programming and debugging of the onboard C Series microcontroller. Official reference can be found [here](#).
Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
debug_tool = ti-icdi
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```ini
[env:myenv]
platform = ...
board = ...
debug_tool = ti-icdi
upload_protocol = ti-icdi
```

More options:

- Debugging options
- Upload options

Drivers

Windows  Please “USB Driver Installation” guide for your board.

Mac  Not required.

Linux  Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

Platforms

**TIAO USB Multi-Protocol Adapter (TUMPA)**

The TIAO USB Multi Protocol Adapter (TUMPA) is a multi-functional USB communication adapter for hobbyists or engineers. The adapter is based on FDTI's flagship communication chip FT2232H, a USB 2.0 Hi-Speed (480Mb/s) to UART/FIFO IC. It has two multi-protocol synchronous serial engines (MPSSEs) which allow for communication using JTAG, I2C and SPI on two channels simultaneously. Official reference can be found [here](#).

Configuration

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
debuge_tool = tumpa
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
debuge_tool = tumpa
upload_protocol = tumpa
```

More options:
- `Debugging options`
- `Upload options`

Drivers

- **Windows**
  - Step-by-step guide: Drivers, Zadig, Wiring
  - Video tutorial

- **Mac** macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

- **Linux** Please install “udev” rules `99-platformio-udev.rules`. If you already installed them before, please check that your rules are up-to-date or repeat steps.

</table>
The UM232H is a USB-to-serial/FIFO development module in the FTDI product range which utilizes the FT232H USB Hi-Speed (480Mb/s) single-port bridge chip to handle the USB signaling and protocols. Official reference can be found here.

**Configuration**

You can configure debugging tool using `debug_tool` option in “platformio.ini” (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
download_tool = um232h
```

If you would like to use this tool for firmware uploading, please change upload protocol:

```
[env:myenv]
platform = ...
board = ...
download_tool = um232h
upload_protocol = um232h
```

More options:
• Debugging options
• Upload options

Drivers

Windows

• Step-by-step guide: Drivers, Zadig, Wiring
• Video tutorial

Mac macOS contains default FTDIUSBSerialDriver driver which conflicts with debug tools which are based on this chip. FTDI Chip company recommends removing this default driver from a system. Everything should work after system rebooting. See detailed instruction in official application note (Page 16, Section 4: Uninstalling FTDI Drivers on OS X) AN134: FTDI Drivers Installation guide for MAC OS X

Linux Please install “udev” rules 99-platformio-udev.rules. If you already installed them before, please check that your rules are up-to-date or repeat steps.

Wiring Connections

Please read 4. UM232H Pin Out and Signal Descriptions section for details.

Whisper

Whisper is a RISCV instruction set simulator (ISS) developed for the verification of the Swerv micro-controller. It allows the user to run RISCV code without RISCV hardware. It has an interactive mode where the user can single step the target RISCV code and inspect/modify the RISCV registers or the simulated system memory. It can also run in lock step with a Verilog simulator serving as a “golden model” against which an implementation is checked after each instruction of a test program. Official reference can be found here.

Custom

**Configuration**  `debug_tool = custom`

**PlatformIO Debugging Solution** can be configured using "platformio.ini" (Project Configuration File):

**Examples**

- J-Link and ST Nucleo
- J-Link as debugger and uploader
- ST-Util and ST-Link
- OpenOCD and ST-Link
- pyOCD and CMSIS-DAP

**J-Link and ST Nucleo**

Segger J-Link probe and ST Nucleo F446RE board in pair with J-Link GDB Server:

- Install J-Link GDB Server
- Convert ST-LINK On-Board Into a J-Link

**Note:** You can use configuration below in pair with other boards, not only with ST Nucleo F446RE. In this case, please replace `STM32F446RE` with your own device name in `debug_server` option.

See full list with J-Link Supported Devices.

```ini
[env:debug_jlink]
platform = ststm32
framework = mbed
board = nucleo_f446re

debug_tool = custom
debug_port = :2331
debug_server = /full/path/to/JLinkGDBServerCL -singlerun -if SWD
```

(continues on next page)
J-Link as debugger and uploader

Segger J-Link probe as debugger and uploader for a custom board. If you plan to use with other board, please change device MK20DX256xxx7 to a valid identifier. See supported J-Link devices at J-LINK.

- Install J-Link GDB Server

```ini
[env:jlink_debug_and_upload]
platform = teensy
framework = arduino
board = teensy31
extra_scripts = extra_script.py
upload_protocol = custom
debug_tool = jlink
debug_server = /full/path/to/JLinkGDBServerCL
-singlerun
-if
-swd
-select
usb
-port
2331
-device
MK20DX256xxx7
```

extra_script.py

Place this file on the same level as “platformio.ini” (Project Configuration File).
from os import makedirs
from os.path import isdir, join
Import('env')

def _jlink_cmd_script(env, source):
    build_dir = env.subst("$BUILD_DIR")
    if not isdir(build_dir):
        makedirs(build_dir)
    script_path = join(build_dir, "upload.jlink")
    commands = ["h", "loadbin %s,0x0" % source, "r", "q"]
    with open(script_path, "w") as fp:
        fp.write("\n".join(commands))
    return script_path

env.Replace(__jlink_cmd_script=_jlink_cmd_script,
            UPLOADER="/full/path/to/JLink",
            UPLOADERFLAGS=[
                "-device", "MK20DX256xxx7",
                "-speed", "4000",
                "-if", "swd",
                "-autoconnect", "1"
            ],
            UPLOADCMD="$UPLOADER $UPLOADERFLAGS -CommanderScript ${__jlink_cmd_script(__env__, SOURCE)}")

ST-Util and ST-Link

On-board ST-Link V2/V2-1 in pair with ST-Util GDB Server:

[env:debug]
platform = ststm32
framework = mbed
board = ...
debug_tool = custom
debug_port = :4242
debug_server = $PLATFORMIO_CORE_DIR/packages/tool-stlink/bin/st-util

OpenOCD and ST-Link

On-board ST-Link V2/V2-1 in pair with OpenOCD GDB Server:

[env:debug]
platform = ststm32
framework = mbed
board = ...
debug_tool = custom
debug_port = $PLATFORMIO_CORE_DIR/packages/tool-openocd/bin/openocd
debug_server =
  $PLATFORMIO_CORE_DIR/packages/tool-openocd/scripts/board/st_nucleo_f4.cfg
pyOCD and CMSIS-DAP

Using pyOCD for CMSIS-DAP based boards

Firstly, please install pyOCD and check that `pyocd-gdbserver --version` command works.

```python
[env:debug]
platform = ...
board = ...

1.14.4 CLI Guide

1.14.5 Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Aceinna IMU</strong></td>
<td>Open-source, embedded development platform for Aceinna IMU hardware. Run custom algorithms and navigation code on Aceinna IMU/INS hardware.</td>
</tr>
<tr>
<td>Atmel AVR 8-bit</td>
<td>Atmel AVR 8-bit MCUs deliver a unique combination of performance, power efficiency and design flexibility. Optimized to speed time to market and easily adapt to new ones - they are based on the industry's most code-efficient architecture for C and assembly programming.</td>
</tr>
<tr>
<td>Atmel SAM</td>
<td>Atmel SMART offers Flash-based ARM products based on the ARM Cortex-MO+, Cortex-M3 and Cortex-M4 architectures, ranging from 8KB to 2MB of Flash including a rich peripheral and feature mix.</td>
</tr>
<tr>
<td><strong>CHIPS Alliance</strong></td>
<td>The CHIPS Alliance develops high-quality, open source hardware designs relevant to silicon devices and FPGAs.</td>
</tr>
<tr>
<td>Espressif 32</td>
<td>Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.</td>
</tr>
<tr>
<td><strong>Freescale Kinetics</strong></td>
<td>Freescale Kinetics Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetics MCUs offer exceptional low-power performance, scalability and feature integration.</td>
</tr>
<tr>
<td>GigaDevice GD32V</td>
<td>The GigaDevice GD32V device is a 32-bit general-purpose microcontroller based on the RISC-V core with an impressive balance of processing power, reduced power consumption and peripheral set.</td>
</tr>
<tr>
<td>Infineon XMC</td>
<td>Infineon has designed the XMC microcontrollers for real-time critical applications with an industry-standard core. The XMC microcontrollers can be integrated with the Arduino platform.</td>
</tr>
<tr>
<td>Kendryte K210</td>
<td>Kendryte K210 is an AI capable RISCV64 dual core SoC.</td>
</tr>
<tr>
<td>Maxim 32</td>
<td>Maxim’s microcontrollers provide low-power, efficient, and secure solutions for challenging embedded applications. Maxim’s processors embed cutting-edge technologies to secure data and intellectual property, proven analog circuitry for real-world applications, and battery-conserving low power operation.</td>
</tr>
<tr>
<td>Nordic nRF51</td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazelle.</td>
</tr>
<tr>
<td>Nordic nRF52</td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td>NXP i.MX RT</td>
<td>The i.MX RT series of crossover processors features the Arm Cortex-M core, real-time functionality and MCU usability at a cost-effective price.</td>
</tr>
<tr>
<td><strong>NXP LPC</strong></td>
<td>The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.</td>
</tr>
<tr>
<td><strong>RISC-V GAP</strong></td>
<td>GreenWaves GAP8 IoT application processor enables the cost-effective development, deployment and autonomous operation of intelligent sensing devices that capture, analyze, classify and act on the fusion of rich data sources such as images, sounds or vibrations.</td>
</tr>
<tr>
<td>Shakti</td>
<td>Shakti is an open-source initiative by the RISE group at IIT-Madras, which is not only building open source, high-performance grade processors, but also associated components like interconnect fabrics, verification cores, storage controllers, peripheral IPs and SOC tools.</td>
</tr>
<tr>
<td>SiFive</td>
<td>SiFive brings the power of open source and software automation to the semiconductor industry, making it possible to develop new hardware faster and more affordably than ever before.</td>
</tr>
<tr>
<td><strong>Silicon Labs EFM32</strong></td>
<td>Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory, ultra-low power consumption and high performance.</td>
</tr>
</tbody>
</table>

1.14. Debugging 2543
### 1.14.6 Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Arduino</strong></td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td><strong>CMSIS</strong></td>
<td>The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software re-use, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices</td>
</tr>
<tr>
<td><strong>Espresif IoT Development Framework</strong></td>
<td>ESP-IDF is the official development framework for the ESP32 and ESP32-S Series SoCs.</td>
</tr>
<tr>
<td><strong>FreeRTOS</strong></td>
<td>FreeRTOS is a real-time operating system kernel for embedded devices that has been ported to 40 microcontroller platforms</td>
</tr>
<tr>
<td><strong>Freedom E SDK</strong></td>
<td>Open Source Software for Developing on the SiFive Freedom E Platform</td>
</tr>
<tr>
<td><strong>GigaDevice GD32V SDK</strong></td>
<td>GigaDevice GD32VF103 Firmware Library (SDK) is a firmware function package, including programs, data structures and macro definitions, all the performance features of peripherals of GD32VF103 devices are involved in the package</td>
</tr>
<tr>
<td><strong>Kendryte FreeRTOS SDK</strong></td>
<td>Kendryte SDK with FreeRTOS support</td>
</tr>
<tr>
<td><strong>Kendryte Standalone SDK</strong></td>
<td>Kendryte Standalone SDK without OS support</td>
</tr>
<tr>
<td><strong>Mbed</strong></td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices</td>
</tr>
<tr>
<td><strong>Nuclei SDK</strong></td>
<td>Open Source Software Development Kit for the Nuclei N/NX processors</td>
</tr>
<tr>
<td><strong>PULP OS</strong></td>
<td>PULP is a silicon-proven Parallel Ultra Low Power platform targeting high energy efficiencies. The platform is organized in clusters of RISC-V cores that share a tightly-coupled data memory</td>
</tr>
<tr>
<td><strong>STM32Cube</strong></td>
<td>STM32Cube embedded software libraries, including: The HAL hardware abstraction layer, enabling portability between different STM32 devices via standardized API calls; The Low-Layer (LL) APIs, a light-weight, optimized, expert oriented set of APIs designed for both performance and runtime efficiency</td>
</tr>
<tr>
<td><strong>Shakti SDK</strong></td>
<td>A software development kit for developing applications on Shakti class of processors</td>
</tr>
<tr>
<td><strong>Simba</strong></td>
<td>Simba is an RTOS and build framework with aims to make embedded programming easy and portable</td>
</tr>
<tr>
<td><strong>Standard Peripheral Library</strong></td>
<td>The ST Standard Peripheral Library provides a set of functions for handling the peripherals on the STM32 family of microcontrollers.</td>
</tr>
<tr>
<td><strong>WD Firmware</strong></td>
<td>The WD Firmware package contains firmware applications and Processor Support Package (PSP) for various cores, alongside demos which support all features</td>
</tr>
<tr>
<td><strong>Zephyr RTOS</strong></td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>
</tbody>
</table>

1.15 Unit Testing

Contents
- Demo
- Tutorials and Examples
- Configuration
- Test Types
- Test Runner
- Test Transport
- Workflow
Unit Testing allows you segregating each part of the firmware/program and testing that the individual parts are working correctly. Using PlatformIO Unit Testing Solution you can execute the same tests on the local host machine (native), on the multiple local embedded devices/boards (connected to local host machine), or on both. When testing both, PlatformIO builds firmware on the host machine, uploads into a target device, starts tests, and collects the test results into test reports. The final information will be shown on the host side with informative output and statistic.

Using Remote Development you can start unit tests on the Remote Device from anywhere in the world or integrate with Continuous Integration systems.

1.15.1 Demo

This is a demo of Local & Embedded: Calculator, which demonstrates running embedded tests on physical hardware (Arduino Uno) and native tests on host machine (desktop).

Learn more about pio test command.
1.15.2 Tutorials and Examples

Project Examples

- Embedded: Wiring Blink
- Local & Embedded: Calculator
- PlatformIO Remote Unit Testing Example

For the other examples and source code please follow to PlatformIO Unit Testing Examples repository.

1.15.3 Configuration

PlatformIO Unit Testing Solution can be configured using "platformio.ini" (Project Configuration File)

1.15.4 Test Types

Desktop

PlatformIO Unit Testing Engine builds a test program for a host machine using Native development platform. This test could be run only with the desktop or Continuous Integration VM instance.

**Note:** PlatformIO does not install any toolchains automatically for Native and requires GCC toolchain to be installed on your host machine. Please open Terminal and check that the gcc command is installed.

Embedded

PlatformIO Unit Testing Engine builds a special firmware for a target device (board) and programs it. Then, it connects to this device using configured Serial test_port and communicates via test_transport. Finally, it runs tests on the embedded side, collects results, analyzes them, and provides a summary on a host machine side (desktop).

**Note:** Please note that the PlatformIO Unit Testing Engine uses the first available Serial/UART implementation (depending on a framework) as a communication interface between the PlatformIO Unit Testing Engine and
target device. If you use Serial in your project libraries, please wrap/hide Serial-based blocks with `#ifndef UNIT_TEST` macro.

Also, you can create custom `test_transport` and implement the base interface.

### 1.15.5 Test Runner

Test Runner allows you to process specific environments or ignore a test using “Glob patterns”. You can also ignore a test for specific environments using a `test_ignore` option from “platformio.ini” (Project Configuration File).

**Local**

Allows you to run a test on a host machine or on a target device (board), which is directly connected to the host machine. In this case, you need to use the `pio test` command.

**Remote**

Allows you to run test on a remote machine or remote target device (board) without having to depend on OS software, extra software, SSH, VPN or opening network ports. Remote Unit Testing works in pair with Remote Development. In this case, you need to use the special command `pio remote test`.

PlatformIO supports multiple Continuous Integration systems where you can run unit tests at each integration stage. See real PlatformIO Remote Unit Testing Example.

### 1.15.6 Test Transport

**PlatformIO Unit Testing Engine** uses different transports to communicate with a target device. By default, it uses Serial/UART transport provided by a framework. For example, when `framework = arduino`, the first available Serial will be used. When Native dev-platform is used a native transport will be activated automatically. See example below.

Default baudrate/speed is set to `test_speed`.

You can also define custom transport and implement its interface:

- `unittest_uart_begin();`
- `unittest_uart_putchar(char c);`
- `unittest_uart_flush();`
- `unittest_uart_end();`

**Examples**

1. Custom transport for Native platform
   
   - Set `test_transport = custom` in “platformio.ini” (Project Configuration File)

   ```
   [env:mycustomtransport]
   platform = native
   test_transport = custom
   ```

   - Create `unittest_transport.h` file in `project/test` directory and implement prototypes above
#ifndef UNITTEST_TRANSPORT_H
#define UNITTEST_TRANSPORT_H

#include <stdio.h>

void unittest_uart_begin() {
}

void unittest_uart_putchar(char c) {
    putchar(c);
}

void unittest_uart_flush() {
    fflush(stdout);
}

void unittest_uart_end() {
}

#endif

2. STM32Cube HAL and Nucleo-F401RE: debugging and unit testing

1.15.7 Workflow

1. Create PlatformIO project using the `pio project init` command. For Desktop Unit Testing (on a host machine), you need to use `native`.

; PlatformIO Project Configuration File
;
; Platform: atmelavr
; Board: uno
[env:nodemcu]
platform = espressif8266
framework = arduino
board = nodemcuv2

; Desktop platforms (Win, Mac, Linux, Raspberry Pi, etc)
; See https://docs.platformio.org/page/platforms/native
(continues on next page)
[env:native]
platform = native

2. Create a test folder in a root of your project. See test_dir.
3. Write a test using API. Each test is a small independent program/firmware with its own main() or setup() / loop() functions. Test should start with UNITY_BEGIN() and finish with UNITY_END() calls.

**Warning:** If your board does not support software resetting via Serial.DTR/RTS, you should add at least 2 seconds delay before UNITY_BEGIN(). That time is needed to establish a Serial connection between a host machine and a target device.

delay(2000); // for Arduino framework
wait(2);     // for ARM mbed framework
UNITY_BEGIN();

4. Place a test in the test directory. If you have more than one test, split them into sub-folders. For example, test/test_1/*.c,cpp,h], test_N/*.c,cpp,h], etc. If there is no such directory in the test folder, then PlatformIO Unit Testing Engine will treat the source code of test folder as SINGLE test.
5. Run tests using the pio test command.

**Shared Code**

PlatformIO Unit Testing Engine does not build source code from src_dir folder by default. If you have a shared/common code between your “main” and “test” programs, you have 2 options:

1. **RECOMMENDED.** We recommend splitting the source code into multiple components and placing them into lib_dir (project’s private libraries and components). Library Dependency Finder (LDF) will find and include these libraries automatically in the build process. You can include any library/component header file in your test or program source code via #include <MyComponent.h>.

   See Local & Embedded: Calculator for an example, where we have a “calculator” component in lib_dir folder and include it in tests and the main program using #include <calculator.h>.

2. Manually instruct PlatformIO to build source code from src_dir folder using test_build_project_src option in “platformio.ini” (Project Configuration File):

   ![Code snippet]

   This is very useful if you unit test independent libraries where you can’t split source code.

   **Warning:** Please note that you will need to use #ifdef UNIT_TEST and #endif guard to hide non-test related source code. For example, own main() or setup() / loop() functions.

**1.15.8 API**

Summary of the Unity Test API:
• **Running Tests**
  - `RUN_TEST(func)`

• **Ignoring Tests**
  - `TEST_IGNORE()`
  - `TEST_IGNORE_MESSAGE(message)`

• **Aborting Tests**
  - `TEST_PROTECT()`
  - `TEST_ABORT()`

• **Basic Validity Tests**
  - `TEST_ASSERT_TRUE(condition)`
  - `TEST_ASSERT_FALSE(condition)`
  - `TEST_ASSERT(condition)`
  - `TEST_ASSERT_UNLESS(condition)`
  - `TEST_FAIL()`
  - `TEST_FAIL_MESSAGE(message)`

• **Numerical Assertions: Integers**
  - `TEST_ASSERT_EQUAL_INT(expected, actual)`
  - `TEST_ASSERT_EQUAL_INT8(expected, actual)`
  - `TEST_ASSERT_EQUAL_INT16(expected, actual)`
  - `TEST_ASSERT_EQUAL_INT32(expected, actual)`
  - `TEST_ASSERT_EQUAL_INT64(expected, actual)`
  - `TEST_ASSERT_EQUAL_UINT(expected, actual)`
  - `TEST_ASSERT_EQUAL_UINT8(expected, actual)`
  - `TEST_ASSERT_EQUAL_UINT16(expected, actual)`
  - `TEST_ASSERT_EQUAL_UINT32(expected, actual)`
  - `TEST_ASSERT_EQUAL_UINT64(expected, actual)`
  - `TEST_ASSERT_EQUAL_HEX(expected, actual)`
  - `TEST_ASSERT_EQUAL_HEX8(expected, actual)`
  - `TEST_ASSERT_EQUAL_HEX16(expected, actual)`
  - `TEST_ASSERT_EQUAL_HEX32(expected, actual)`
  - `TEST_ASSERT_EQUAL_HEX64(expected, actual)`
  - `TEST_ASSERT_EQUAL_HEX8_ARRAY(expected, actual, elements)`

• **Numerical Assertions: Bitwise**
  - `TEST_ASSERT_BITS(mask, expected, actual)`

• **Numerical Assertions: Integers**
  - `TEST_ASSERT_TRUE(condition)`
  - `TEST_ASSERT_FALSE(condition)`
  - `TEST_ASSERT(condition)`
  - `TEST_ASSERT_UNLESS(condition)`
  - `TEST_FAIL()`
  - `TEST_FAIL_MESSAGE(message)`

• **Numerical Assertions: Bitwise**
  - `TEST_ASSERT_BITS(mask, expected, actual)`
- TEST_ASSERT_BITS_HIGH(mask, actual)
- TEST_ASSERT_BITS_LOW(mask, actual)
- TEST_ASSERT_BIT_HIGH(mask, actual)
- TEST_ASSERT_BIT_LOW(mask, actual)

- Numerical Assertions: Floats
  - TEST_ASSERT_FLOAT_WITHIN(delta, expected, actual)
  - TEST_ASSERT_EQUAL_FLOAT(expected, actual)
  - TEST_ASSERT_EQUAL_DOUBLE(expected, actual)

- String Assertions
  - TEST_ASSERT_EQUAL_STRING(expected, actual)
  - TEST_ASSERT_EQUAL_STRING_LEN(expected, actual, len)
  - TEST_ASSERT_EQUAL_STRING_MESSAGE(expected, actual, message)
  - TEST_ASSERT_EQUAL_STRING_LEN_MESSAGE(expected, actual, len, message)

- Pointer Assertions
  - TEST_ASSERT_NULL(pointer)
  - TEST_ASSERT_NOT_NULL(pointer)

- Memory Assertions
  - TEST_ASSERT_EQUAL_MEMORY(expected, actual, len)

1.15.9 CLI Guide

1.16 Static Code Analysis

Automated code analysis without hassle!

Static analysis became an important part of software development cycle. It can identify potential bugs, vulnerabilities and security threats by doing an analysis on the source code level without having to test it on hardware or execute any code.

Static Code Analysis helps reduce development cost by enabling engineers to detect the precise location of defects and eliminate issues more efficiently and earlier in the development cycle. It can also ensure compliance with internal or industry coding standards such as MISRA, CERT, etc.
1.16.1 Key features

- Fully integrated within the PlatformIO ecosystem and easy to execute on the entire project.
- Straightforward integration with Continuous Integration services.
- Possibility to reuse the same setup on other projects.
- Easy and flexible rule configuration.
- Comprehensive and detailed error information
- Multiple architectures and development platforms.
- Cross-platform: Windows, MacOS, Linux.

Static Code Analysis can detect a wide range of known defects in C/C++ code, including:

- Potential NULL pointer dereferences
- Possible indexing beyond array bounds
- Suspicious assignments
- Reads of potentially uninitialized objects
- Unused variables or functions
- Out of scope memory usage

**Warning:** Before performing a static analysis check, make sure your project builds without errors. For information about how to build a project, see the `pio run` command or VSCode guide.

1.16.2 User Interface

There is the rich and friendly interface for Static Code Analysis in PlatformIO Home. It allows you to filter messages or directly jump to an issue in a source code.

If you enjoy using PlatformIO, please star our projects on GitHub!

**STAR PlatformIO Core**
1.16.3 Configuration

Static Code Analysis allows selecting what tool is used for finding defects in the project, what source files are checked. Static Code Analysis can be configured from “platformio.ini” (Project Configuration File) using the next options:
1.16.4 Check tools

You can switch between or specify multiple tools used for finding defects using `check_tool` option:

```
[env:myenv]
platform = ...
board = ...
check_tool = cppcheck, clangtidy
```

Detailed information about supported check tools and their configuration process can be found on these pages:

Cppcheck

Cppcheck is a static analysis tool for C/C++ code. It provides a unique code analysis to detect bugs and focuses on detecting undefined behavior and dangerous coding constructs. The goal is to detect only real errors in the code (i.e. have very few false positives). More information about this tool on the official webpage.

**Hint:** Cppcheck is rarely wrong about reported errors. But there are many bugs that it doesn’t detect. You will find more bugs in your software by testing your software carefully than by using Cppcheck.

Contents

- Features
- Additional checks
- Configuration
- Extra flags
- Suppressing warnings
- Addons (MISRA, CERT)
  - MISRA
  - CERT

Features

Cppcheck supports a wide variety of static checks that may not be covered by the compiler itself. These checks are static analysis checks that can be performed at a source code level. The program is directed towards static analysis checks that are rigorous, rather than heuristic in nature.

Some of the defects that might be detected include:

- Automatic variable checking
- Bounds checking for array overruns
- Classes checking (e.g. unused functions, variable initialization, and memory duplication)
- Usage of deprecated or superseded functions
- Exception safety checking, for example, usage of memory allocation and destructor checks
- Memory leaks, e.g. due to lost scope without deallocation
- Resource leaks, e.g. due to forgetting to close a file handle
- Invalid usage of Standard Template Library functions and idioms
- Miscellaneous stylistic and performance errors

**Additional checks**

Be default **Cppcheck** is configured to check the next additional defects:

- warning
- style
- performance
- portability
- unusedFunction

The full list of supported check with detailed description is located on the official webpage.

**Configuration**

**Cppcheck** is implicitly used as the default check tool when `check_tool` option in "platformio.ini" (Project Configuration File) is not set. To be explicit, you can specify it in the configuration directly:

```
[env:myenv]
platform = ...
board = ...
check_tool = cppcheck
check_flags = --enable=all
```

Useful options that can be used for adjusting check process:

**Extra flags**

Useful flags that can help more precisely configure **Cppcheck** to satisfy your project requirements:
<table>
<thead>
<tr>
<th>Flag</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>--enable=&lt;id&gt;</code></td>
<td>Enable additional checks. The available ids are: all, warning, style,</td>
</tr>
<tr>
<td></td>
<td>performance, portability, information, unusedFunction, missingInclude</td>
</tr>
<tr>
<td><code>--std=&lt;id&gt;</code></td>
<td>Set standard. The available options are: c89, c99, c11, c++03, c++11,</td>
</tr>
<tr>
<td></td>
<td>c++17, c++20 (default)</td>
</tr>
<tr>
<td><code>--language=&lt;language&gt;</code></td>
<td>Forces Cppcheck to check all files as the given language. Valid values are: c, c++</td>
</tr>
<tr>
<td><code>--inline-suppr</code></td>
<td>Enable inline suppressions. Use them by placing one or more comments, like: // cppcheck-suppress warningId on the lines before the warning to suppress (enabled by default if no extra flags specified).</td>
</tr>
<tr>
<td><code>--suppress=&lt;spec&gt;</code></td>
<td>Suppress warnings that match &lt;spec&gt;. The format of &lt;spec&gt; is: [error id]:[filename]:[line]</td>
</tr>
<tr>
<td><code>--platform=&lt;type&gt;</code></td>
<td>Specifies platform-specific types and sizes. The available built-in platforms are: unix32, unix64, win32A, win32W, win64, avr8, native, unspecified (default)</td>
</tr>
<tr>
<td><code>--inconclusive</code></td>
<td>Allow reporting defects even though the analysis is inconclusive.</td>
</tr>
<tr>
<td><code>-D&lt;ID&gt;</code></td>
<td>Define a preprocessor symbol. Example: -DDEBUG=1</td>
</tr>
<tr>
<td><code>-U&lt;ID&gt;</code></td>
<td>Undefine preprocessor symbol. Use -U to explicitly hide certain #ifdef &lt;ID&gt; code paths from checking. Example: -UDEBUG</td>
</tr>
<tr>
<td><code>-I &lt;dir&gt;</code></td>
<td>Give a path to search for include files. Give several -I parameters to give several paths.</td>
</tr>
<tr>
<td><code>-j &lt;jobs&gt;</code></td>
<td>Start &lt;jobs&gt; threads to do the checking simultaneously.</td>
</tr>
</tbody>
</table>

### Suppressing warnings

It might be useful to explicitly instruct `Cppcheck` to ignore some of the known defects in project codebase. Since `--inline-suppr` is enabled by default, it’s possible to directly mark pieces of code that will be excluded from `Cppcheck` report using `// cppcheck-suppress warningId` syntax.

**Note:** Warning ID can be found in square brackets at the end of defect description, for example: `src\Blink.cpp:17: [low:style] The function 'loop' is never used. [unusedFunction]`

By default, Static Code Analysis command doesn’t scan framework sources and that’s why some functions from in your project might be reported as unused. For example, you can ignore warnings about `setup` and `loop` functions from Arduino-based projects:

```cpp
// cppcheck-suppress unusedFunction
void setup()
{
    ...
}

// cppcheck-suppress unusedFunction
void loop()
{
    ...
}
```
Addons (MISRA, CERT)

**Cppcheck** provides several addon scripts that analyze dump files to check compatibility with secure coding standards and to locate various issues. Most useful addons for verifying compliance with popular guidelines are **MISRA** and **CERT**.

**MISRA**

MISRA is a proprietary set of software development guidelines for the C/C++ programming languages developed by MISRA (Motor Industry Software Reliability Association). It aims to facilitate code safety, security, portability, and reliability in the context of embedded systems, specifically those systems programmed in ISO C/C++.

**Note:** Since this standard is proprietary, **Cppcheck** does not display error text by specifying only the number of violated rules (for example, [c2012-21.3]). If you want to display full texts for violated rules, you will need to create a text file containing MISRA rules, which you will have to pass when calling the script with **--rule-texts** flag.

In order to use MISRA addon you will need to provide a special file with the description of MISRA rules. Usually, it has the next contents:

```
Appendix A Summary of guidelines
Rule 3.1 Required
R3.1 Rule description
Rule 4.1 Required
...
Rule 21.3 Required
R21.3 Rule description
Rule 21.4
R21.4 Rule description
```

Next, you need to instruct **Cppcheck** that you want to run an additional addon script. Since this script requires an additional file with rules, you can pass it via a special **json** file:

```
{
  "script": "addons/misra.py",
  "args": ["--rule-texts=misra-rules.txt"]
}
```

Finally, add new flag to **check_flags**:

```
[env:myenv]
platform = ...
board = ...
check_tool = cppcheck
check_flags =
  cppcheck: --addon=misra.json
```

The full list of implemented MISRA checks can be found on the official webpage.

**CERT**

SEI CERT coding standard provides rules for secure coding in the C programming language. The goal of these rules and recommendations is to develop safe, reliable, and secure systems, for example by eliminating undefined behaviors that can lead to undefined program behaviors and exploitable vulnerabilities.
In order to use the CERT addon, simply specify it as an additional flag in `check_flags` section:

```
[env:myenv]
platform = ...
board = ...
check_tool = cppcheck
check_flags =
    cppcheck: --addon=cert.py
```

**Clang-Tidy**

Clang-Tidy is a clang-based C++ “linter” tool. Its purpose is to provide an extensible framework for diagnosing and fixing typical programming errors, like style violations, interface misuse, or bugs that can be deduced via static analysis. Official page can be found here.

### Contents

- Features
- Configuration
- Supported checks
- Extra flags

**Features**

Clang-Tidy supports a large variety of static checks that may not be covered by the compiler itself. These checks are static analysis checks that can be performed at a source code level.

Some of the defects that might be detected include:

- Buffer overflow
- Potential NULL pointer dereferences
- Use of memory that has already been deallocated
- Out of scope memory usage
- Failure to set a return value from a subroutine

**Configuration**

To enable Clang-Tidy tool simply add it to the `check_tool` option in “platformio.ini” (Project Configuration File):

```
[env:myenv]
platform = ...
board = ...
check_tool = clangtidy
```

Useful options that can be used used for adjusting check process:
Supported checks

There are currently the following groups of most used checks (By default all checks are enabled):

<table>
<thead>
<tr>
<th>Check</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abseil-*</td>
<td>Checks related to Abseil library.</td>
</tr>
<tr>
<td>boost-*</td>
<td>Checks related to Boost library.</td>
</tr>
<tr>
<td>bugprone-*</td>
<td>Checks that target bugprone code constructs.</td>
</tr>
<tr>
<td>cert-*</td>
<td>Checks related to CERT Secure Coding Guidelines.</td>
</tr>
<tr>
<td>cppcoreguidelines-*</td>
<td>Checks related to C++ Core Guidelines.</td>
</tr>
<tr>
<td>clang-analyzer-*</td>
<td>Clang Static Analyzer checks.</td>
</tr>
<tr>
<td>google-*</td>
<td>Checks related to Google coding conventions.</td>
</tr>
<tr>
<td>hicpp-*</td>
<td>Checks related to High Integrity C++ Coding Standard.</td>
</tr>
<tr>
<td>modernize-*</td>
<td>Checks that advocate usage of modern (currently modern means C++11) language constructs.</td>
</tr>
<tr>
<td>performance-*</td>
<td>Checks that target performance-related issues.</td>
</tr>
<tr>
<td>portability-*</td>
<td>Checks that target portability-related issues that don’t relate to any particular coding style.</td>
</tr>
<tr>
<td>readability-*</td>
<td>Checks that target readability-related issues that don’t relate to any particular coding style.</td>
</tr>
</tbody>
</table>

The full list of supported checks can be found on the official webpage.

Extra flags

Useful flags that can help more precisely configure Clang-Tidy to satisfy your project requirements:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>--checks=&lt;string&gt;</td>
<td>Comma-separated list of enabled checks (*) default)</td>
</tr>
<tr>
<td>--fix</td>
<td>Apply suggested fixes. Without --fix-errors clang-tidy will bail out if any compilation errors were found.</td>
</tr>
<tr>
<td>--fix-errors</td>
<td>Apply suggested fixes even if compilation errors were found. If compiler errors have attached fix-its, clang-tidy will apply them as well.</td>
</tr>
<tr>
<td>--format-style=&lt;string&gt;</td>
<td>Style for formatting code around applied fixes: llvm, google, webkit, mozilla, none (default)</td>
</tr>
<tr>
<td>--system-headers</td>
<td>Display the errors from system headers.</td>
</tr>
</tbody>
</table>

An example with enabling specific checks and fixing code on the fly:

```plaintext
[env:myenv]
platform = ...
board = ...
check_tool = clangtidy
check_flags =
   clangtidy: --checks=-*,cert-*,clang-analyzer-* --fix
```

PVS-Studio

PVS-Studio is a static code analysis tool for detecting bugs and security weaknesses in the source code of programs, written in C, C++, C# and Java. It analyze source code intended for 32-bit, 64-bit and embedded ARM platforms.
Official page can be found here.

### Contents

- Features
- Configuration
- Extra flags
- Obtaining license

### Features

**PVS-Studio** performs a wide range of code checks, and it is also useful in finding misprints and Copy-Paste errors. These checks are static analysis checks that can be performed at a source code level. Some of the defects that might be detected include:

- Arithmetic over/underflow
- Array index out of bounds
- Undefined/unspecified behavior
- Incorrect usage of exceptions
- Buffer overrun
- Null pointer/null reference dereference
- Improper understanding of function/class operation logic
- Illegal bitwise/shift operations

The full list of supported checks can be found on the official webpage.

### Configuration

To enable **PVS-Studio** tool simply add it to the `check_tool` option in the `platformio.ini` (Project Configuration File):

```ini
[env:myenv]
platform = ...
board = ...
check_tool = pvs-studio
```

Useful options that can be used for adjusting check process:

### Extra flags

Useful flags that can help more precisely configure **PVS-Studio** to satisfy your project requirements:
Flag | Meaning
--- | ---
--analysis-mode <arg> | Analysis mode (0 - full analysis (default), 1 - 64-bit. analysis, 2 - reserved, 4 - general analysis, 8 - optimization, 16 - customer’s specific requests, 32 - MISRA)
--analyzer-errors <arg> | Errors activation (Default: all errors is on)
--errors-off <arg> | Errors OFF (Default: all errors is on)
--exclude-path <arg> | All code that is located under the path will be excluded from analysis
--lic-file <arg> | Path to custom license file. Default locations ~/.config/PVS-Studio/PVS-Studio.lic on Unix and %APPDATA%\PVS-Studio\PVS-Studio.lic on Windows
--rules-config <arg> | Specifies the path to rules configuration file.
--platform <arg> | Platform name (Win32, x64, etc) (Default: ARM)

An example with a special analysis mode, disabled errors and license file:
```
[env:myenv]
platform = ...
board = ...
check_tool = pvs-studio
check_flags =
    pvs-studio: --analysis-mode=4 --errors-off=V532,V586 --lic-file=/path/to/file.lic
```

**Obtaining license**

Since **PVS-Studio** is a paid B2B solution, a license should be purchased. But PVS-Studio can be used for free of charge, for example for checking open source projects. More information about the cases when you can get a free **PVS-Studio** license can be found on the official webpage.

**Tip:** If you’re experiencing problems with the license file or see the following error message: License information is incorrect. Please check your registration data or contact Customer Support, try saving the license file in UTF-8 + BOM format with the following contents:

```
n@domain.com
AAAA-BBBB-CCCC-DDDD
```

### 1.16.5 Defect severity

Defect severity is a classification of software defect (bug, vulnerability, etc) that indicates the degree of negative impact on the quality of software. **Static Code Analysis** uses the next classification of possible defects:

<table>
<thead>
<tr>
<th>Severity</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>high</td>
<td>Issues that are possibly bugs</td>
</tr>
<tr>
<td>medium</td>
<td>Suggestions about defensive programming in order to prevent potential bugs</td>
</tr>
<tr>
<td>low</td>
<td>Issues related to code cleanup and performance (unused functions, redundant code, const-ness, etc)</td>
</tr>
</tbody>
</table>

### 1.16. Static Code Analysis
1.16.6 CLI Guide

Static Code Analysis can be configured using command line commands. Detailed description of these commands can be found here:

1.17 Remote Development

Your devices are always with you!

PlatformIO Remote Development Solution allows you to work remotely with devices from Anywhere In The World. No matter where you are now! Run a small and cross-platform PlatformIO Remote Agent on a remote machine and you are able to list active devices (wireless + wired), to upload firmware (program), to process remote unit tests, or to start remote debugging session via Remote Serial Port Monitor.

Using PlatformIO Remote Development Solution you can share your devices with colleagues across your organization or friends. In combination with Cloud IDE, you can create awesome things at any time when inspiration comes to you.

You should have PlatformIO Account to use PlatformIO Remote Development Solution. A registration is FREE.

1.17.1 Features

- Remote Device Manager
- Remote Serial Port Monitor
- Remote Firmware Updates
- Share devices with your team members
- Continuous Deployment
- Continuous Delivery
- Remote Unit Testing

1.17.2 Use Cases

Cloud IDE Program your devices from anywhere in the world using the most popular Cloud IDE. You do not need to install any extra software, no need to have static IP or open network ports. Everything works out of the box.
Devices behind card sized PC Work with your favorite development environment and program devices connected to card-sized PC (Raspberry Pi, Cubie Board, etc.). You do not need to open SSH ports, install any extra Linux packages, toolchains.

Remote Unit Testing Instruct any of Continuous Integration services to run remote tests on a physical device. See the documentation for Remote Test Runner.

How does it work?

- You commit new changes to your source code repository
- Continuous Integration service deploys unit tests to a remote agent
- Unit Testing engine runs tests on a physical device, process them, and send results
- Continuous Integration service prints results in human readable format
- If one test fails, current CI build will fail too.

Board Farm A similar concept as described in “Remote Unit Testing” above. Let’s imagine that you need to test some logic on the unlimited number of target devices. Very often it can be the same hardware prototype but with different factory revisions.

You connect these devices via USB hub to PC and instruct PlatformIO Remote Development Solution to process your test on ALL targets connected to a specific agent. See documentation below.

Remote Serial Monitor Sometimes you don’t have physical access to a target device but you need to read data from some serial port. PlatformIO Remote Development Solution allows you to connect to a remote agent and list connected devices with their serial ports. See pio remote device monitor command for details.
1.17.3 Technology

![PIO Remote™ Architecture Diagram]

- Authentication Protocol
- Transport Protocol

**TCP/IP Stack**

**Links**
- **USB Link**: Wired devices
- **Ethernet Link**: Wired devices
- **Wi-Fi Link**: Wireless devices
PlatformIO Remote Development Solution is an own PlatformIO technology for remote solutions without external dependencies to operating system or its software based on client-server architecture. The Server component (PlatformIO Cloud) plays a role of coupling link between PlatformIO Remote Agent and Client (PlatformIO Remote CLI, Cloud IDE, Continuous Integration, SDKs, etc.). When you start PlatformIO Remote Agent, it connects over the Internet with PlatformIO Cloud and listen for the actions/commands which you can send in Client role from anywhere in the world.

PlatformIO Remote Development Solution is multi-agents and multi-clients system. A single agent can be shared with multiple clients, where different clients can use the same agent. This approach allows one to work with distributed hardware located in the different places, networks, etc.

This technology allows one to work with remote devices in generic form as you do that with local devices using PlatformIO ecosystem. The only one difference is a prefix “remote” before each generic PlatformIO command. For example, listing of local and remote devices will look like pio device list and pio remote device list.

1.17.4 Installation

PlatformIO Remote Development Solution is built into PlatformIO IDE. Please open PlatformIO IDE Terminal and run pio remote --help command for usage (see PlatformIO Remote CLI).

If you do not have PlatformIO IDE, or use Cloud IDE or a card-sized PC (Raspberry Pi, BeagleBoard, etc.), please install PlatformIO Core (CLI).

1.17.5 Quick Start

1. Start PlatformIO Remote Development Solution Agent using pio remote agent start command on a remote machine where devices are connected physically or are accessible via network. PlatformIO Remote Development Solution Agent works on Windows, macOS, Linux and Linux ARMv6+. It means that you can use desktop machine, laptop or credit card sized PC (Raspberry Pi, BeagleBoard, etc).

   You can share own devices/hardware with friends, team or other developers using pio remote agent start --share option.

2. Using host machine (PlatformIO Remote CLI, Cloud IDE Terminal in a browser, SDKs, etc.), please authorize via pio account login command with the same credentials that you used on the previous step. Now, you can use PlatformIO Remote CLI commands to work with remote machine and its devices.

   You don’t have to networking or other access to remote machine where PlatformIO Remote Development Solution Agent is started.

   If you use PlatformIO Remote Development Solution in pair with Continuous Integration or want automatically authorize, please set PLATFORMIO_AUTH_TOKEN system environment variable instead of using pio account login command.

Note: In case with Cloud IDE, your browser with Cloud IDE’s VM is a “host machine”. The machine where devices are connected physically (your real PC) is called “remote machine” in this case. You should run PlatformIO Remote Development Solution Agent here (not in Cloud IDE’s Terminal).

Note: Please use local IP as “upload port” when device is not connected directly to a remote machine where PlatformIO Remote Development Solution Agent is started but supports natively Over-the-Air (OTA) updates. For example, Espressif 8266 and Over-the-Air (OTA) update. In this case, the final command for remote OTA update will look as pio remote run -t upload --upload-port 192.168.0.255 or pio remote run -t upload --upload-port myesp8266.local.
1.17.6 CLI Guide

1.18 PlatformIO Account

PlatformIO Account is required for:
- Community Forum
- Remote Development
- Managing organizations and owners of an organization
- Managing teams and team memberships
- Managing packages in the registry
- Managing resource (package) access.

1.18.1 PlatformIO IDE

PlatformIO IDE has built-in UI in PlatformIO Home to manage PlatformIO Account. You can create a new account, reset your password, update profile, or fetch an authentication token. This UI must be used to login with OAuth.

1.18.2 CLI Guide

1.19 Cloud & Desktop IDE

1.19.1 Native Extensions

Native extensions and plugins provide official integration with IDEs/Text Editors and contain built-in PlatformIO Core (CLI) and PlatformIO Home. We highly recommend to use the next native integrations for:
- VSCode
- CLion (Experimental)

Note: In our experience, VSCode offers better system performance, and users have found it easier to get started

1.19.2 Cloud IDE

Cloud9

Cloud9 combines a powerful online code editor with a full Ubuntu workspace in the cloud. Workspaces are powered by Docker Ubuntu containers that give you full freedom over your environment, including sudo rights. Do a git push, compile SASS, see server output, and Run apps easily with the built-in Terminal and Runners.

Contents
- Cloud9
  - Demo
Note:

1. Please make sure to read Remote Development guide first.
2. You need PlatformIO Account if you don’t have it. Registration is FREE.
3. You should have a running PlatformIO Remote Agent on a remote machine where hardware devices are connected physically or accessible for the remote operations. See Remote Development Quick Start for details.

Demo
Integration

1. Sign in to Cloud9. A registration is FREE and gives you for FREE 1 private workspace (where you can host multiple PlatformIO Projects) and unlimited public workspaces.

2. Create a new workspace using Blank template

Create a new workspace

<table>
<thead>
<tr>
<th>Workspace name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>platformio-workspace</td>
<td>Workspace for private PlatformIO Projects</td>
</tr>
</tbody>
</table>

Hosted workspace | Clone workspace | Remote SSH workspace | Salesforce

- **Private**
  - This is a workspace for your eyes only

- **Public**
  - This will create a workspace for everybody to see

Clone from Git or Mercurial URL (optional)

```
e.g. ajaxorg/ace or git@github.com:ajaxorg/ace.git
```

Choose a template

- HTML5
- Node.js
- PHP
- Python
- Django
- Ruby
- C++
- Wordpress
- Rails Tutorial
- Blank
- Harvard’s CS50

Create workspace

3. Install PlatformIO Core (CLI) using Cloud IDE Terminal. Paste a next command

```
sudo python -c "$(curl -fsSL https://raw.githubusercontent.com/platformio/platformio/develop/scripts/get-platformio.py)"
```
4. Log in to PlatformIO Account using `pio account login` command.

**Quick Start**

Let’s create our first PlatformIO-based Cloud9 Project

1. Initialize new PlatformIO-based Project. Run a next command in Cloud IDE Terminal:

   ```
   pio project init --board <ID>
   # initialize project for Arduino Uno
   pio project init --board uno
   ```

   To get board ID please use `pio boards` command or Embedded Boards Explorer.

2. Create new source file named `main.cpp` in `src` folder using Project Tree (left side). Please make right click on `src` folder, then “New File” and insert a next content:

   ```
   #include <Arduino.h>

   int i = 0;

   void setup() {
     Serial.begin(9600);
     Serial.println("Hello Cloud9!");
   }
   ```

   (continues on next page)
```c
void loop() {
    /* serial echo */
    while (Serial.available()) {
        Serial.write(Serial.read());
    }
    i++;
    Serial.println(i);
    delay(100);
}
```

3. If you prefer to work with PlatformIO Core (CLI) CLI, then you can process project using Cloud IDE Terminal and the next commands:

   - `pio run` - build project locally (using Cloud IDE’s virtual machine)
   - `pio run -t clean` - clean project
   - `pio remote run -t upload` - upload firmware (program) to a remote device
   - `pio remote device list` - list available remote devices
PlatformIO Build System

Cloud9 allows one to create own build system and use hotkey or command (Menu: Run > Build) to build a project.

Let’s create PlatformIO Build System that will be used for C/C++/H/INO/PDE files by default. Please click on Menu: Run > Build System > New Build System and replace all content with the next:

```json
{
    "cmd" : ["pio", "run", "-d", "$file"],
    "info" : "Building $project_path/$file_name",
    "selector": "^.*\.(cpp|c|h|hpp|S|ini|ino|pde)$"
}
```

Save new Build System and give a name PIOBuilder. Now, you can select it as default Build System using Menu: Run > Build System > PIOBuilder.

Remote Device Manager

Remote Device Manager works in pair with Remote Development. You can list remote devices that are connected to host machine where PlatformIO Remote Agent is started or are visible for it.

Let’s create New Run Configuration (shortcut) that will be used for Remote Device Manager. Please click on Menu: Run > Run Configurations > Manage..., then “Add New Config” and specify the next values:

- **First Blank Input**: a name of runner. Please set it to “PIO: Remote Devices”
- **Command**: set to pio remote device list
- **Runner**: set to “Shell command”
Remote Firmware Uploading

Remote Firmware Uploading works in pair with Remote Development. You can deploy firmware (program) to any devices which are visible for PlatformIO Remote Agent.

Let’s create New Run Configuration (shortcut) that will be used for Remote Firmware Uploading. Please click on Menu: Run > Run Configurations > Manage..., then “Add New Config” and specify the next values:

- **First Blank Input**: a name of runner. Please set it to “PIO: Remote Upload”
- **Command**: set to `pio remote run -t upload`
- **Runner**: set to “Shell command”

============================================================================= [SUCCESS] Took 3.109 seconds
Remote Serial Port Monitor

Remote Serial Port Monitor works in pair with Remote Development. You can read or send data to any device that is connected to host machine where PlatformIO Remote Agent is started. To list active agents please use this command `pio remote agent list`.

Let’s create New Run Configuration (shortcut) that will be used for Remote Serial Port Monitor. Please click on Menu: Run > Run Configurations > Manage..., then “Add New Config” and specify the next values:

- **First Blank Input**: a name of runner. Please set it to “PIO: Remote Serial Monitor”
- **Command**: set to `pio remote device monitor`
- **Runner**: set to “Shell command”

Multi-Project workspace

You can have multiple PlatformIO-based Projects in the same workspace. We recommend a next folders structure:

```
project-A
  lib
    README
    platformio.ini
  src
```

(continues on next page)
In this case, you need to create 2 “New Run Configuration” for Remote Firmware Uploading with using the next commands:

- `pio remote run --project-dir project-A -t upload` for Project-A
- `pio remote run -d project-B -t upload` for Project-B

See documentation for `pio remote run --project-dir` option.

**Codeanywhere**

Codeanywhere is a Cross Platform Cloud IDE and it has all the features of Desktop IDE but with additional features only a cloud application can give you! Codeanywhere is very flexible and you can set up your workflow any way you want it. The elegant development environment will let you focus on building great applications quicker. All the features you will need for any coding task are built into Codeanywhere, making development more productive and fun.

**Contents**

- **Codeanywhere**
  - Demo
  - Integration
  - Quick Start
  - Run Button
  - Remote Device Manager
  - Remote Firmware Uploading
  - Remote Serial Port Monitor
  - Multi-Project workspace

**Note:**

1. Please make sure to read Remote Development guide first.
2. You need PlatformIO Account if you don’t have it. Registration is FREE.
3. You should have a running PlatformIO Remote Agent on a remote machine where hardware devices are connected physically or accessible for the remote operations. See Remote Development Quick Start for details.
Demo

1. Sign in to Codeanywhere. A registration is FREE and gives you unlimited private projects within the one Container.

2. Open Dashboard Projects

3. Create a new Project and open it. In Connection Wizard create new Container:
   - **Name** set to “PlatformIO”
   - **Stack** search for Python stack (not Python3) that is based on Ubuntu OS.
   - Click on “Create” button.

Integration

1. **Sign in to Codeanywhere.** A registration is FREE and gives you unlimited private projects within the one Container.

2. **Open Dashboard Projects**

3. Create a new Project and open it. In Connection Wizard create new Container:
   - **Name** set to “PlatformIO”
   - **Stack** search for Python stack (not Python3) that is based on Ubuntu OS.
   - Click on “Create” button.
4. Open **SSH-Terminal** tab (right click on **Container (PlatformIO)** > **SSH Terminal**) and install **PlatformIO Core (CLI)** using a next command

```
sudo python -c "$(curl -fsSL https://raw.githubusercontent.com/platformio/platformio/develop/scripts/get-platformio.py)"
```
5. Log in to PlatformIO Account using pio account login command.

Quick Start

Let’s create our first PlatformIO-based Codeanywhere Project

1. Initialize new PlatformIO-based Project. Run a next command in a Cloud IDE SSH Terminal:

   ```
   pio project init --board <ID>
   # initialize project for Arduino Uno
   pio project init --board uno
   ```

   To get board ID please use pio boards command or Embedded Boards Explorer.

   If you do not see created project, please refresh Project Tree using right-click on Container Name (PlatformIO) > Refresh.

2. Create new source file named main.cpp in src folder using Project Tree (left side). Please make right click on src folder, then “Create File” and insert a next content:

   ```
   #include <Arduino.h>
   int i = 0;
   void setup() {
   ```

(continues on next page)
Serial.begin(9600);
Serial.println("Hello Codeanywhere!");

void loop() {
    /* serial echo */
    while (Serial.available()) {
        Serial.write(Serial.read());
    }
    i++;
    Serial.println(i);
    delay(100);
}

3. If you prefer to work with PlatformIO Core (CLI) CLI, then you can process project using Cloud IDE SSH Terminal and the next commands:
• *pio run* - build project locally (using Cloud IDE’s virtual machine)
• *pio run -t clean* - clean project
• *pio remote run -t upload* - upload firmware (program) to a remote device
• *pio remote device list* - list available remote devices
• *pio remote device monitor* - Remote Serial Port Monitor

4. We recommend to hide “Hidden Files”. You can do that via Cloud IDE Menu: View > Show Hidden Files.

### Run Button

Codeanywhere provides a quick “Run Project” button where you can specify own command. Let’s add “PlatformIO Build Project” command:

1. Open “Project Config” via right click on Container Name (PlatformIO) > Config
2. Set commands field to

   ```json
   "commands": [
     "pio run"
   ]
   ```

Now, try to click on “Run Project” button. You can assign any PlatformIO command to this button.
```json
"run": [
  {
    "name": "default",
    "default": "true",
    // current working dir
    "cwd": "~/workspace",
    // run commands list
    "commands": [
      "pio run"
    ],
    // environment variables
    // example:
    "environment": {
      // "PYTHONPATH": "~/Python"
    },
    // if "preview" is set, it will open the link in a
    // preview panel after setting environment variables
    // and all commands have been executed
    "preview": {
      "url": "http://{{DOMAIN}}:{{PORT}}/",
      "type": "external"
    },
    "find_in_files": {
      "ignore": [
        // file types to ignore in search
        ".git", ".svn"
      ]
    }
  }
]```
Remote Device Manager

Remote Device Manager works in pair with *Remote Development*. You can list remote devices that are connected to host machine where *PlatformIO Remote Agent* is started or are visible for it.

1. Open Cloud IDE SSH Terminal
2. Paste this command

```bash
pio remote device list
```

Remote Firmware Uploading

Remote Firmware Uploading works in pair with *Remote Development*. You can deploy firmware to any devices which are visible for *PlatformIO Remote Agent*.

1. Open Cloud IDE SSH Terminal
2. Paste this command

```bash
pio remote run -t upload
```
Remote Serial Port Monitor

Remote Serial Port Monitor works in pair with Remote Development. You can read or send data to any device that is connected to host machine where PlatformIO Remote Agent is started. To list active agents please use this command `pio remote agent list`.

1. Open Cloud IDE SSH Terminal
2. Paste this command

```bash
pio remote device monitor
```

Verbose mode can be enabled via `-v` option

Looking for upload port...
Auto-detected: /dev/cu.usbmodemFA1411
Uploading .pioenvs/uno/firmware.hex

avrdude: AVR device initialized and ready to accept instructions

Reading | ############################################################## | 100% 0.00s

avrdude: Device signature = 0x1e950f
avrdude: reading input file "pioenvs/uno/firmware.hex"
avrdude: writing flash (2578 bytes):

Writing | ############################################################## | 100% 0.39s

avrdude: 2578 bytes of flash written
avrdude: verifying flash memory against .pioenvs/uno/firmware.hex:
avrdude: load data flash data from input file .pioenvs/uno/firmware.hex:
avrdude: input file .pioenvs/uno/firmware.hex contains 2578 bytes
avrdude: reading on-chip flash data:

Reading | ############################################################## | 100% 0.31s

avrdude: verifying ...
avrdude: 2578 bytes of flash verified

avrdude done. Thank you.
Multi-Project workspace

You can have multiple PlatformIO-based Projects in the same workspace. We recommend a next folders structure:

```
- project-A
  - lib
    - README
  - platformio.ini
  - src
    - main.ino
- project-B
  - lib
    - README
  - platformio.ini
  - src
    - main.cpp
    - main.h
```

In this case, you need to use `-d, --project-dir` option for `pio run` or `pio remote run` commands:

- `pio remote run --project-dir project-A -t upload` build Project-A

- `pio remote run --project-dir project-A -t upload remote firmware uploading` using Project-A

- `pio remote run -d project-B -t upload remote firmware (program) uploading` using Project-B

See documentation for `pio remote run --project-dir` option.
Eclipse Che

Eclipse Che is an open-source Java based developer workspace server and cloud integrated development environment (IDE) which provides a remote development platform for multi-user purpose. The workspace server comes with a RESTful webservice and provides high flexibility. It also contains a SDK which can be used to create plug-ins for languages, frameworks or tools.

Contents

- Eclipse Che
  - Demo
  - Integration
  - Quick Start
  - Multi-Project workspace

Note:

1. Please make sure to read Remote Development guide first.
2. You need PlatformIO Account if you don’t have it. Registration is FREE.
3. You should have a running PlatformIO Remote Agent on a remote machine where hardware devices are connected physically or accessible for the remote operations. See Remote Development Quick Start for details.
Demo

Integration

1. Sign in to Codenvy (based on Eclipse Che). A registration is FREE and gives you unlimited private projects.
2. Open Workspaces tab
3. Click on “Add Workspace”, then switch to “Runtime” tab.
   - **Name** set to “PlatformIO”
   - **Stack** search for **PLATFORMIO**
   - Click on “Create” button, then “Open”.

4. Using opened Terminal, please log in to **PlatformIO Account** using `pio account login` command.

**Quick Start**

Let’s create our first PlatformIO-based Codenvy Project

1. Click on Menu: **Workspace > Create New Project** and select `platformio-arduino-blink` sample. Set “Name” to “Arduino Blink” and press “Create”.
2. Now you can use dropdown Commands menu and process project with “run” command
3. If you prefer to work with *PlatformIO Core (CLI)* CLI, then you can process project using Cloud IDE Terminal and the next commands:

   - `pio run` - build project locally (using Cloud IDE’s virtual machine)
   - `pio run -t clean` - clean project
- `pio remote run -t upload` - upload firmware (program) to a remote device
- `pio remote device list` - list available remote devices
- `pio remote device monitor` - Remote Serial Port Monitor

### Multi-Project workspace

You can have multiple PlatformIO-based Projects in the same workspace. We recommend a next folders structure:

```
- project-A
  - lib
    - README
    - platformio.ini
  - src
    - main.ino

- project-B
  - lib
    - README
    - platformio.ini
  - src
    - main.cpp
    - main.h
```

In this case, you need to use `-d, --project-dir` option for `pio run` or `pio remote run` commands:

- `pio remote run --project-dir project-A -t upload` build Project-A
- `pio remote run --project-dir project-A -t upload` remote firmware uploading using Project-A
- `pio remote run -d project-B -t upload` remote firmware (program) uploading using Project-B

See documentation for `pio remote run --project-dir` option.

### 1.19.3 Desktop IDE

**PlatformIO IDE for Atom**

PlatformIO IDE is the next-generation integrated development environment for IoT.

- Cross-platform build system without external dependencies to the OS software:
  - 800+ **Boards**
  - 35+ **Development Platforms**
  - 20+ **Frameworks**
- **Debugging**
- **Remote Development**
- **Unit Testing**
- C/C++ Intelligent Code Completion
- C/C++ Smart Code Linter for rapid professional development
- Library Manager for the hundreds popular libraries
• Multi-projects workflow with multiple panes
• Themes support with dark and light colors
• Serial Port Monitor
• Built-in Terminal with PlatformIO Core (CLI) and CLI tool (pio, platformio)
• Built-in PlatformIO Home.

Atom is a text editor that’s modern, approachable, yet hackable to the core—a tool you can customize to do anything but also use productively without ever touching a config file.
Installation

Note: Please note that you do not need to install PlatformIO Core (CLI) separately if you are going to use PlatformIO IDE for Atom. PlatformIO Core (CLI) is built into PlatformIO IDE and you will be able to use it within PlatformIO IDE Terminal.

Also, PlatformIO IDE allows one to install PlatformIO Core (CLI) Shell Commands (pio, platformio) globally to your system via Menu: PlatformIO > Install Shell Commands.
I. Atom

0. **Download** and install GitHub’s official Atom text editor. PlatformIO IDE is built on top of it.

1. **Open** Atom Package Manager
   - **Mac OS X**, Menu: Atom > Preferences > Install
   - **Windows**, Menu: File > Settings > Install
   - **Linux**, Menu: Edit > Preferences > Install

2. **Search** for the official `platformio-ide` package

3. **Install** PlatformIO IDE.

II. Clang for Intelligent Code Completion

PlatformIO IDE uses Clang for the Intelligent Code Completion. To check that `clang` is available in your system, please open Terminal and run `clang --version`. If `clang` is not installed, then **install it and restart Atom**:

- **Mac OS X**: Install the latest Xcode along with the latest Command Line Tools (they are installed automatically when you run `clang` in Terminal for the first time, or manually by running `xcode-select --install`)

- **Windows**: Download Clang 3.9.1 for Windows. Please select “Add LLVM to the system PATH” option on the installation step.
  - Clang 3.9.1 for Windows (32-bit)
  - Clang 3.9.1 for Windows (64-bit)
Warning: PLEASE DO NOT INSTALL CLANG 4.0. TEMPORARILY, WE SUPPORT ONLY CLANG 3.9.

If you see a Failed to find MSBuild toolsets directory error in the installation console, please ignore it and press any key to close this window. PlatformIO IDE uses only the Clang completion engine, which should work after that without any problems.

- **Linux:** Using package managers: `apt-get install clang` or `yum install clang`.
- **Other Systems:** Download the latest Clang for the other systems.

Warning: If some libraries are not visible in PlatformIO IDE for Atom and Code Completion or Code Linting does not work properly, please perform Menu: PlatformIO > Rebuild C/C++ Project Index (Autocomplete, Linter)

Quick Start

This tutorial introduces you to the basics of PlatformIO IDE workflow and shows you the creation process for a simple “Blink” example. After finishing, you will have a general understanding of how to work with projects in the IDE.

Launch

After installation, launch PlatformIO IDE by opening Atom. Once Atom is opened, the PlatformIO IDE auto installer will continue to install dependent packages and PlatformIO Core (CLI). Please be patient and let the installation
complete. Once finished, PlatformIO IDE will ask you to reload the Atom window to apply installed components. Please click on Reload Now. After that, PlatformIO IDE is ready for use. Happy coding!

Setting Up the Project

1. Click on the “PlatformIO Home” button on the PlatformIO Toolbar

2. Click on “New Project”, select a board and create a new PlatformIO Project
3. Open the main.cpp file in the src folder and replace its contents with the following:

```c
/**
 * Blink
 *
 * Turns on an LED on for one second,
 * then off for one second, repeatedly.
 */
```

**Warning:** The code below only works with Arduino-based boards. Please visit the PlatformIO Project Examples repository for other pre-configured projects.
```c
#include "Arduino.h"

// Set LED_BUILTIN if it is not defined by Arduino framework
#define LED_BUILTIN 13

void setup()
{
  // initialize LED digital pin as an output.
  pinMode(LED_BUILTIN, OUTPUT);
}

void loop()
{
  // turn the LED on (HIGH is the voltage level)
  digitalWrite(LED_BUILTIN, HIGH);

  // wait for a second
  delay(1000);

  // turn the LED off by making the voltage LOW
  digitalWrite(LED_BUILTIN, LOW);

  // wait for a second
  delay(1000);
}
```
Process Project

PlatformIO IDE proposes different ways to process the project (build, clean, upload firmware, run other targets) using:

- **PlatformIO Toolbar**
- **Menu item PlatformIO**
- **Building / Uploading / Targets** and hotkeys

```cpp
/**
 * Blink
 *
 * Turns on an LED on for one second,
 * then off for one second, repeatedly.
 */

#include "Arduino.h"

// Set LED_BUILTIN if it is not defined by Arduino
// #define LED_BUILTIN 13

void setup()
{
  // initialize LED digital pin as an output
  pinMode(LED_BUILTIN, OUTPUT);
}

void loop()
{
  // turn the LED on (HIGH is the voltage level)
  digitalWrite(LED_BUILTIN, HIGH);

  // wait for a second
  delay(1000);

  // turn the LED off by making the voltage low
  digitalWrite(LED_BUILTIN, LOW);
}
```
5. Run **Build** and you should see a green “success” result in the build panel:
To upload firmware to the board, run Upload.

6. What is more, you can run specific target or process project environment using Menu: PlatformIO > Run other target... or call targets list from the status bar (bottom, left corner):
And select desired target:
7. To launch the built-in terminal interface, choose Menu: PlatformIO > Terminal or press the corresponding icon in the PlatformIO toolbar:
This provides you fast access to a set of powerful PlatformIO Core (CLI) CLI commands:
8. To run the built-in “Serial Monitor”, choose Menu: PlatformIO > Serial Monitor or press the corresponding icon in the PlatformIO toolbar:
The monitor has several settings to adjust your connection:
It also allows you to communicate with your board in an easy way:
Menu item PlatformIO

platformio-ide package adds to Atom new menu item named Menu: PlatformIO (after Menu: Help item).
PlatformIO Toolbar

PlatformIO IDE Toolbar contains quick access buttons for the popular commands. Each button contains a hint (leave the mouse on it for a moment).

- **PlatformIO Home**
- PlatformIO: Build
- PlatformIO: Upload
- PlatformIO: Clean
- **Debugging**
• Run other target (Build environments, Unit Testing)
• Toggle build panel
• ||
• Find in Project…
• PlatformIO Terminal
• Serial Monitor
• ||
• Atom Settings

Building / Uploading / Targets

• cmd-alt-b/ctrl-alt-b/f9 builds project without auto-uploading.
• cmd-alt-u/ctrl-alt-u builds and uploads (if no errors).
• cmd-alt-c/ctrl-alt-c cleans compiled objects.
• cmd-alt-t/ctrl-alt-t/f7 run other targets (Upload using Programmer, Upload SPIFFS image, Update platforms and libraries).
• cmd-alt-g/ctrl-alt-g/f4 cycles through causes of build error.
• cmd-alt-h/ctrl-alt-h/shift-f4 goes to the first build error.
• cmd-alt-v/ctrl-alt-v/f8 toggles the build panel.
• escape terminates build / closes the build window.

Intelligent Code Completion

PlatformIO IDE uses clang for the Intelligent Code Completion. To install it or check if it is already installed, please follow see the step II. Clang for Intelligent Code Completion from Installation guide.

Warning: The libraries which are added/installed after the initializing process will not be reflected in the code linter. You need Menu: PlatformIO > Rebuild C/C++ Project Index (Autocomplete, Linter).

Smart Code Linter

PlatformIO IDE uses PlatformIO’s pre-built GCC toolchains for Smart Code Linter and rapid professional development. The configuration data are located in .gcc-flags.json. This file will be automatically created and preconfigured when you initialize project using Menu: PlatformIO > Initialize new PlatformIO Project or update existing….

Warning: If some libraries are not visible in PlatformIO IDE for Atom and Code Completion or Code Linting does not work properly, please perform Menu: PlatformIO > Rebuild C/C++ Project Index (Autocomplete, Linter).
Install Shell Commands

Please navigate to PlatformIO Core Install Shell Commands.

Known issues

Smart Code Linter is disabled for Arduino files

*Smart Code Linter* is disabled by default for Arduino files (*.ino and .pde) because they are not valid C/C++ based source files:

1. Missing includes such as `#include <Arduino.h>`
2. Function declarations are omitted.

There are two solutions:

- Convert Arduino file to C++ manually
- Force Arduino file as C++

Convert Arduino file to C++ manually

Recommended! See *Convert Arduino file to C++ manually*.

Force Arduino file as C++

To force Smart Code Linter to use Arduino files as C++ please

1. Open `.gcc-flags.json` file from the Initialized/Imported project and add `-x c++` flag at the beginning of the value of `gccDefaultCppFlags` field:

```json
{
    "execPath": "...",
    "gccDefaultCFlags": "...",
    "gccDefaultCppFlags": "-x c++ -fsyntax-only ...",
    "gccErrorLimit": 15,
    "gccIncludePaths": "...",
    "gccSuppressWarnings": false
}
```

2. Perform all steps from *Convert Arduino file to C++ manually* (without renaming to .cpp).

**Warning:** Please do not modify other flags here. They will be removed on a next “Project Rebuild C/C++ Index” stage. Please use `build_flags` for “platformio.ini” (Project Configuration File) instead.

Arch Linux: PlatformIO IDE Terminal issue

Please read this article Installing PlatformIO on Arch Linux.
Frequently Asked Questions

Keep build panel visible

PlatformIO IDE hides build panel on success by default. Nevertheless, you can keep it visible all time. Please follow to Menu: PlatformIO > Settings > Build and set Panel Visibility to Keep Visible.

Key-bindings (toggle panel):
- cmd+alt+v - Mac OS X
- ctrl+alt+v - Windows/Linux

Automatically save on build

If you want automatically save all edited files when triggering a build, please follow to Menu: PlatformIO > Settings > Build and check Automatically save on build.

Jump to Declaration

Click on a function/include, press F3 and you will be taken directly to the declaration for that function.

Code Formatting

You need to install atom-beautify package and C/C++ Uncrustify Code Beautifier.

Uninstall Atom with PlatformIO IDE

Here’s how to uninstall the PlatformIO IDE for multiple OS.

See Uninstall PlatformIO Core and dependent packages, if you do not need it in a system.

Windows

1. Uninstall Atom using “Start > Control Panel > Programs and Features > Uninstall”
2. Remove C:\Users\<user name>\.atom folder (settings, packages, etc...)
3. Remove C:\Users\<user name>\AppData\Local\atom folder (application itself)
4. Remove C:\Users\<user name>\AppData\Roaming\Atom folder (cache, etc.)
5. Remove registry records using regedit:
   - HKEY_CLASSES_ROOT\Directory\Background\shell
   - HKEY_CLASSES_ROOT\Directory\shell
   - HKEY_CLASSES_ROOT*\shell
macOS

Run these commands in system Terminal

```bash
rm -rf ~/.atom
rm /usr/local/bin/atom
rm /usr/local/bin/apm
rm -rf /Applications/Atom.app
rm ~/Library/Preferences/com.github.atom.plist
rm ~/Library/Application\ Support/com.github.atom.ShipIt
rm -rf ~/Library/Application\ Support/Atom
rm -rf ~/Library/Saved\ Application\ State/com.github.atom.savedState
rm -rf ~/Library/Caches/com.github.atom
rm -rf ~/Library/Caches/Atom
```

Linux

Run these commands in system Terminal

```bash
rm /usr/local/bin/atom
rm /usr/local/bin/apm
rm -rf ~/atom
rm -rf ~/.atom
rm -rf ~/.config/Atom-Shell
rm -rf /usr/local/share/atom/
```

CLion

CLion is a cross-platform C/C++ IDE for Linux, OS X, and Windows. CLion includes such features as a smart editor, code generation, code quality assurance, automated refactorings, on-the-fly code analysis, project manager, integrated version control systems and debugger.

Refer to the CLion Documentation page for more detailed information.
Contents

- Installation
- Known issues
  - Project configuration and CMake
  - CLion does not load project build environments from "platformio.ini"
  - Arduino .ino files are not supported
• **Quick Start**
  – *Setting Up the Project*
  – *Build & Upload*
    * Configuration options
• **Device/Serial Monitor**
• **Debugging**
  – *Peripheral Registers*
• **PlatformIO Home**

## Installation

1. Install PlatformIO Core (CLI). See *Installation* guide

   **Warning:** This a temporary step and depends on CLion #CPP-19412: Automatically install PlatformIO Core

2. Download and install CLion IDE

3. Install official PlatformIO for CLion plugin. Open “Configure > Plugins” window and go to the “Marketplace” tab. Search for PlatformIO and press the “Install” button.
1. Open "Configure > Plugins > Marketplace"

2. Search for "PlatformIO"

3. Install plugin
4. Restart CLion IDE.

Note: We also recommend to install Ini plugin that provides syntax highlighting, formatting, code folding, and viewing structure for "platformio.ini" (Project Configuration File).

Known issues

Project configuration and CMake

PlatformIO does not depend on “CMake” and uses own multi-platform build system. Project configuration, such as build flags, library dependencies, etc., should be declared in “platformio.ini” (Project Configuration File).

Warning: Please note that “PlatformIO for CLion” plugin does not update automatically CLion configuration. There is a feature request CLion #CPP-18367: Follow platformio.ini changes and update the project.

Update CLion configuration: “Tools > PlatformIO > Re-Init”

CLion does not load project build environments from “platformio.ini”

This is a known issue CLion CPP-19478: CLion does not handle “CMAKE_CONFIGURATION_TYPES” from CMakeLists.txt. A temporary solution is to manually configure project profiles in CLion.

Please open CLion Settings and navigate to “Build, Execution, Deployment > CMake”. Press “+” button and PlatformIO-based project profiles:
Arduino `.ino` files are not supported

CLion uses “CMake” tool for code completion and code linting. As a result, it doesn’t support the Arduino files (*.ino and .pde) because they are not valid C/C++ based source files:

1. Missing includes such as #include `<Arduino.h>`
2. Function declarations are omitted.

See how to [Convert Arduino file to C++ manually](#).

**Quick Start**

This tutorial introduces you to the basics of PlatformIO for CLion workflow and shows you a creation process of a simple “Blink” example. After finishing you will have a general understanding of how to work with projects in the CLion IDE.
Setting Up the Project

1. Please open “New Project” wizard, select board and framework, and create a new PlatformIO project. Please **USE ONLY** Latin characters (a-z) in a project name to avoid further issues with project compilation. Numbers and some symbols are allowed depending on a file system:

   ![PlatformIO New Project Wizard](image)

   **Project Name**
   - only [a-z0-9_] characters

2. Rename `main.c` file in `src` folder to `main.cpp` (right click on a file `main.c`, Refactor > Rename…).

   Paste the next contents:

   ```
   Warning: The code below works only in pair with Arduino-based boards. Please follow to PlatformIO Project Examples repository for other pre-configured projects.
   
   /*! Blink
   *
   * Turns on an LED on for one second,
   * then off for one second, repeatedly.
   */
   
   #include "Arduino.h"
   // Set LED_BUILTIN if it is not defined by Arduino framework
   // #define LED_BUILTIN 13

   void setup()
   {
     // initialize LED digital pin as an output.
     pinMode(LED_BUILTIN, OUTPUT);
   }
   ```

   (continues on next page)
void loop()
{
    // turn the LED on (HIGH is the voltage level)
    digitalWrite(LED_BUILTIN, HIGH);

    // wait for a second
    delay(1000);

    // turn the LED off by making the voltage LOW
    digitalWrite(LED_BUILTIN, LOW);

    // wait for a second
    delay(1000);
}
Build & Upload

1. Open project configuration wizard and add PlatformIO Upload and PlatformIO Debug configurations (you can add the rest configurations if you need them):

2. Remove pre-task (“Build”) from PlatformIO Upload and PlatformIO Debug configurations to avoid double project building. You should see “There are no tasks to run before launch”.

2662 Chapter 1. Contents
3. Select PlatformIO Upload configuration and use the “Build” button for project compilation or the “Run” for a firmware uploading:
Configuration options

- **Build options**
- **Upload options**

Device/Serial Monitor

Please open CLion terminal and use *Device Manager CLI*. You can also configure device monitor per project using *Monitor options*.

Please note that you need to manually close/stop device monitor before firmware uploading.
PlatformIO Documentation, Release 5.0.5a1

Debugging

“PlatformIO for CLion” supports Debugging which allows you to debug your application with 1-Click without extra steps. Please select PlatformIO Debug configuration and press the “Debug” button:

Peripheral Registers

Please navigate to the “Peripheral” tab in a “Debug” view, press the “Configure” icon and select registers to monitor. Close configuration window.

Warning: Currently, CLion does not load automatically Peripheral Register Definitions (SVD file) provided by PlatformIO. There is a feature request CLion #CPP-18369: Support CLION_SVD_FILE_PATH CMake variable
to auto-find svd file
1.19. Cloud & Desktop IDE
PlatformIO Home

Nevertheless, you can start it manually and open in your browser. Please note that some features do not work, such as project opening. Please open CLion terminal and run `pio home` command:

```
pio -c clion home
```

- [Tutorials and Examples](#) (step-by-step tutorials with debugging and unit testing)
- [CLion documentation](#)

**Happy coding with PlatformIO!**

**CodeBlocks**

Code::Blocks is a free, open-source cross-platform IDE that supports multiple compilers including GCC, Clang and Visual C++. It is developed in C++ using wxWidgets as the GUI toolkit. Using a plugin architecture, its capabilities and features are defined by the provided plugins. Currently, Code::Blocks is oriented towards C, C++, and Fortran.

CodeBlocks IDE can be downloaded from [here](#).
Contents

- CodeBlocks
  - Integration

Integration

Integration process consists of these steps:

1. Open system Terminal and install PlatformIO Core (CLI)
2. Create new folder for your project and change directory (`cd`) to it
3. Generate a project using PlatformIO Core Project Generator (`pio project init --ide`)
4. Import project in IDE.

Choose board ID using `pio boards` or Embedded Boards Explorer command and generate project via `pio project init --ide` command:

```
PIO project init --ide codeblocks --board <ID>
```

(continues on next page)
For example, generate project for Arduino UNO
pio project init --ide codeblocks --board uno

Then:

1. Open this project via Menu: File > Open...
2. Add new files to src directory (*.c, *.cpp, *.ino, etc.) via Menu: File > New > File..
3. Build project using Menu: Build > Build
4. Upload firmware using Menu: Build > Run

**Warning:** The libraries which are added, installed or used in the project after generating process won’t be reflected in IDE. To fix it you need to reinstall project using `pio project init` (repeat it).

**Eclipse**

The **Eclipse CDT (C/C++ Development Tooling)** Project provides a fully functional C and C++ Integrated Development Environment based on the Eclipse platform. Features include: support for project creation and managed build for various toolchains, standard make build, source navigation, various source knowledge tools, such as type hierarchy, call graph, include browser, macro definition browser, code editor with syntax highlighting, folding and hyperlink navigation, source code refactoring and code generation, visual debugging tools, including memory, registers, and disassembly viewers.

Refer to the [CDT Documentation](#) page for more detailed information.

1.19. Cloud & Desktop IDE
Integration

Integration process consists of these steps:

1. Open system Terminal and install PlatformIO Core (CLI)
2. Create new folder for your project and change directory (cd) to it
3. Generate a project using PlatformIO Core Project Generator (pio project init --ide)
4. Import project in IDE.

Choose board ID using pio boards or Embedded Boards Explorer command and generate project via pio project init --ide command:

```
pio project init --ide eclipse --board <ID>
# For example, generate project for Arduino UNO
pio project init --ide eclipse --board uno
```

Then:

1. Import this project via Menu: File > Import... > General > Existing Projects into Workspace > Next and specify root directory where is located “platformio.ini” (Project Configuration File)
2. Open source file from src directory (*.c, *.cpp, *.ino, etc.)
3. Build project using Menu: Project > Build Project or pre-configured Make Targets (see screenshot below):
   - PlatformIO: Build - Build project without auto-uploading
   - PlatformIO: Clean - Clean compiled objects.
   - PlatformIO: Test - Unit Testing
   - PlatformIO: Upload - Build and upload (if no errors)
   - PlatformIO: Upload using Programmer see Upload using Programmer
   - PlatformIO: Upload SPIFFS image see Using Filesystem
   - PlatformIO: Update platforms and libraries - Update installed platforms and libraries via pio update
   - PlatformIO: Rebuild C/C++ Project Index - Rebuild C/C++ Index for the Project. Allows one to fix code completion and code linting issues.

If you have some problems with unresolved includes, defines, etc., then

1. Rebuild PlatformIO Project Index: Menu: PlatformIO: Rebuild C/C++ Project Index target
2. Rebuild Eclipse Project Index: Menu: Project > C/C++ Index > Rebuild
3. Refresh Project, right click on the project Project > Refresh (F5) or restart Eclipse IDE.

**Warning:** The libraries which are added, installed or used in the project after generating process won’t be reflected in IDE. To fix it please run PlatformIO: Rebuild C/C++ Project Index target and right click on the project and Project > Refresh (F5).
Warning: The C/C++ GCC Cross Compiler Support package must be installed in Eclipse, otherwise the CDT Cross GCC Built-in Compiler Settings provider will not be available (check the Providers tab in Project > Properties > C/C++ General > Preprocessor Include Paths, Macros etc. for a marked entry named CDT Cross GCC Built-in Compiler Settings).

If this provider is not available, toolchain related includes cannot be resolved.

Live Integration

Eclipse Virtual IoT Meetup: PlatformIO: a cross-platform IoT solution to build them all!

Debugging

A debugging feature is provided by Debugging and new debug configuration named “PlatformIO Debugger” is created. No need to do extra configuration steps:

1. Build a project first time or after “Clean” operation using PlatformIO: Build target
2. Launch debugger via “Menu: Debug” or “Bug Icon” button on Tool Bar.
3. Wait for a while, PlatformIO will prepare project for debugging and session will be started soon.

Articles / Manuals

- May 05, 2016 - Ivan Kravets, Ph.D. / Eclipse Virtual IoT Meetup - PlatformIO: a cross-platform IoT solution to build them all!
Emacs

GNU Emacs is an extensible, customizable text editor - and more. At its core is an interpreter for Emacs Lisp, a dialect of the Lisp programming language with extensions to support text editing.

Refer to the Emacs Documentation page for more detailed information.

Contents

- Emacs
  - Integration
    * Project Generator
    * PlatformIO-Mode
  * Code Completion and Navigation
Integration

Integration process consists of these steps:

1. Open system Terminal and install PlatformIO Core (CLI)
2. Create new folder for your project and change directory (cd) to it
3. Generate a project using PlatformIO Core Project Generator (pio project init --ide)
4. Open project in Emacs.

Project Generator

Choose board ID using pio boards or Embedded Boards Explorer command and generate project via pio project init --ide command:

```
pio project init --ide emacs --board <ID>
```

**Warning:** The libraries which are added, installed or used in the project after generating process won’t be reflected in IDE. To fix it you need to reinitialize project using pio project init (repeat it).

PlatformIO-Mode

An Emacs minor mode has been written to facilitate building and uploading from within Emacs. It can be installed from the MELPA repository using M-x package-install. See the MELPA Getting Started page for more information.

Setup instructions and an example config can be found at the Github page.

There are 6 predefined targets for building.

- `platformio_build` - Build project without auto-uploading. (C-c i b)
- `platformio_clean` - Clean compiled objects. (C-c i c)
- `platformio_upload` - Build and upload (if no errors). (C-c i u)
- `platformio_programmer_upload` - Build and upload using external programmer (if no errors, see Upload using Programmer). (C-c i p)
- `platformio_spiffs_upload` - Upload files to file system SPIFFS (see Using Filesystem). (C-c i s)
- `platformio_update` - Update installed platforms and libraries. (C-c i d)

Code Completion and Navigation

Please install the next:

- C/C++/ObjC language server supporting cross references, hierarchies, completion and semantic highlighting
- Emacs client for ccls, a C/C++ language server.
NetBeans

NetBeans is a Java-based integrated development environment (IDE). It provides out-of-the-box code analyzers and editors for working with the latest Java 8 technologies—Java SE 8, Java SE Embedded 8, and Java ME Embedded 8. The IDE also has a range of new tools for HTML5/JavaScript, in particular for Node.js, KnockoutJS, and AngularJS; enhancements that further improve its support for Maven and Java EE with PrimeFaces; and improvements to PHP and C/C++ support.

NetBeans IDE can be downloaded from here. Just make sure you download the C/C++ version (or if you already use NetBeans, install the C/C++ development plugins).

**Warning:** Note that the version of NetBeans IDE provided by some Linux package repositories may be a Flatpak version, which are known to have issues with accessing the PlatformIO CLI installed due to the container nature of this technology. It is recommended that you use the native version of the NetBeans IDE via the above link.

1.19. Cloud & Desktop IDE
Integration

Integration process consists of these steps:

1. Open system Terminal and install *PlatformIO Core (CLI)*
2. Create new folder for your project and change directory (`cd`) to it
3. Generate a project using PlatformIO Core Project Generator (`pio project init --ide`)
4. Import project in IDE.

Choose board ID using `pio boards` or Embedded Boards Explorer command and generate project via `pio project init --ide` command:

```
pio project init --ide netbeans --board <ID>
# For example, generate project for Arduino UNO
pio project init --ide netbeans --board uno
```

Then:

1. Open this project via Menu: File > Open Project...
2. Add new files to `src` directory (*.c, *.cpp, *.ino, etc.) via right-click on `src` folder in the “Projects” pane
3. Build project using Menu: Run > Build Project
4. Upload firmware using Menu: Run > Run Project

**Warning:** The libraries which are added, installed or used in the project after generating process won’t be reflected in IDE. To fix it you need to reinitialize project using `pio project init` (repeat it).

Articles / Manuals

- Feb 22, 2016 - Grzegorz Holdys - How to Integrate PlatformIO with Netbeans

See the full list with *Articles about us*.

Qt Creator

The *Qt Creator* is an open source cross-platform integrated development environment. The editor includes such features as syntax highlighting for various languages, project manager, integrated version control systems, rapid code navigation tools and code autocompletion.

Refer to the *Qt-creator Manual* page for more detailed information.
Integration process consists of these steps:

1. Open system Terminal and install *PlatformIO Core (CLI)*
2. Create new folder for your project and change directory (`cd`) to it
3. Generate a project using PlatformIO Core Project Generator (`pio project init --ide`)
4. Import project in IDE.
Project Generator

Choose board ID using `pio boards` or Embedded Boards Explorer command and generate project via `pio project init --ide` command:

```
pio project init --ide qtcreator --board <ID>
```

# For example, generate project for Arduino UNO
```
pio project init --ide qtcreator --board uno
```

Then:

1. Import project via File > Open File or Project and select `platformio.pro` from the folder where is located "platformio.ini" (Project Configuration File)

2. Select default desktop kit and click on Configure Project (Projects mode, left panel)

3. Set General > Build directory to the project directory where is located "platformio.ini" (Project Configuration File)

4. Remove all items from Build Steps, click on Build Steps > Add Build Step > Custom Process Step and set:
   - **Command**: platformio
   - **Arguments**: `-f -c qtcreator run
   - **Working directory**: `%{buildDir}`

5. Remove all items from Clean Steps, click on Clean Steps > Add Clean Step > Custom Process Step and set:
   - **Command**: platformio
   - **Arguments**: `-f -c qtcreator run --target clean
   - **Working directory**: `%{buildDir}`

6. Update PATH in Build Environment > PATH > EDIT with the result of this command (paste in Terminal):

   ```
   # Linux, Mac
   echo $PATH
   # Windows
   echo %PATH%
   ```

7. Switch to Edit mode (left panel) and open source file from src directory (*.c, *.cpp, *.ino, etc.)

8. Build project: Menu: Build > Build All.
Warning: The libraries which are added, installed or used in the project after generating process won’t be reflected in IDE. To fix it you need to reinitialize project using `pio project init` (repeat it).

Manual Integration

Setup New Project

First of all, let’s create new project from Qt Creator Start Page: New Project or using Menu: File > New File or Project, then select project with Empty Qt Project type (Other Project > Empty Qt...
Project), fill Name, Create in.

On the next steps select any available kit and click Finish button.
Secondly, we need to delete default build and clean steps and configure project with PlatformIO Build System (click on Projects label on left menu or Ctrl+5 shortcut):
Thirdly, change project file by adding path to directories with header files. Please edit project file to match the following contents:

```
win32 {
    HOMEDIR += $$\$(USERPROFILE)
}
else {
    HOMEDIR += $$\$(HOME)
}

INCLUDEPATH += "$$\$(HOMEDIR)/.platformio/packages/framework-arduinoavr/cores/arduino"
INCLUDEPATH += "$$\$(HOMEDIR)/.platformio/packages/toolchain-atmelavr/avr/include"
```
First program in Qt Creator

Simple “Blink” project will consist from two files: 1. In the console, navigate to the root of your project folder and initialize pio project with `pio project init` 2. The main “C” source file named `main.c` must be located in the `src` directory. Let’s create new text file named `main.c` using Menu: New File or Project > General > Text File:
Copy the source code which is described below to file `main.c`.

```c
#include "Arduino.h"
#define WLED 13  // Most Arduino boards already have an LED attached to pin 13 on the board itself

void setup()
{
    pinMode(WLED, OUTPUT);  // set pin as output
}

void loop()
{
    digitalWrite(WLED, HIGH);  // set the LED on
delay(1000);                  // wait for a second
digitalWrite(WLED, LOW);      // set the LED off
delay(1000);                  // wait for a second
}
```

3. Locate the project configuration file named `platformio.ini` at the root of the project directory and open it.
Edit the content to match the code described below.

```plaintext
; PlatformIO Project Configuration File
;
; Build options: build flags, source filter, extra scripting
; Upload options: custom port, speed and extra flags
; Library options: dependencies, extra library storages
;
; Please visit documentation for the other options and examples
; https://docs.platformio.org/page/projectconf.html

[env:arduino_uno]
platform = atmelavr
framework = arduino
board = uno
```

Conclusion

Taking everything into account, we can build project with shortcut Ctrl+Shift+B or using Menu: Build > Build All.
Sublime Text

The Sublime Text is a cross-platform text and source code editor, with a Python application programming interface (API). Sublime Text is proprietary software. Its functionality is extendable with plugins. Most of the extending packages have free-software licenses and are community-built and maintained. Sublime Text lacks graphical setting dialogues and is entirely configured by editing text files.

Refer to the Sublime Text Documentation page for more detailed information.

Contents

- Deviot Plugin
- Integration
  - Project Generator
  - Manual Integration
    - Initial configuration
    - Command Hotkeys
Deviot Plugin

We are glad to inform you about an awesome Sublime Text plugin for IoT development named Deviot. It is based on PlatformIO Core (CLI) and will automatically install it for you. Please visit official Deviot page for the further installation steps and documentation.

Integration

Project Generator

Integration process consists of these steps:

1. Open system Terminal and install **PlatformIO Core (CLI)**
2. Create new folder for your project and change directory (cd) to it
3. Generate a project using PlatformIO Core Project Generator (**pio project init --ide**) 
4. Import project in IDE.

Choose board ID using **pio boards** or **Embedded Boards Explorer** command and generate project via **pio project init --ide** command:

```
pio project init --ide sublimetext --board <ID>
```

# For example, generate project for Arduino UNO
```
pio project init --ide sublimetext --board uno
```

Then:

1. Import project via Menu: Project > Open Project... and select platformio.
   sublimetext-project from the folder where is located “platformio.ini” (Project Configuration File)
2. Select PlatformIO as build system: Menu: Tools > Build System > PlatformIO
3. Open source file from src directory (*.c, *.cpp, *.ino, etc.)

Also, you can access to all pre-configured targets via Menu: Tools > Builds With... (ST3)

- **PlatformIO - Build** - Build project without auto-uploading
- **PlatformIO - Clean** - Clean compiled objects.
- **PlatformIO - Test** - **Unit Testing**
- **PlatformIO - Upload** - Build and upload (if no errors)
- **PlatformIO - Upload using Programmer** see Upload using Programmer

1.19. Cloud & Desktop IDE 2689
- PlatformIO - Upload SPIFFS image see *Using Filesystem*
- PlatformIO - Update platforms and libraries - Update installed platforms and libraries via *pio update*.

**Manual Integration**

**Note:** Please verify that folder where is located `platformio` program is added to PATH (wiki) environment variable.

**Initial configuration**

First of all, we need to create “New Build System” with name “PlatformIO” from Menu: **Tools > Build System > New Build System** and fill it like described below:

```json
{
    "cmd": ["platformio", "-f", "--c", "sublimetext", "run"],
    "working_dir": "${project_path:${folder}}",
    "variants": [
        {
            "name": "Clean",
            "cmd": ["platformio", "-f", "--c", "sublimetext", "run", "--target", "clean"]
        },
        {
            "name": "Upload",
            "cmd": ["platformio", "-f", "--c", "sublimetext", "run", "--target", "upload"]
        }
    ]
}
```

Secondly, we need to select “PlatformIO” Build System from a list:
After that, we can use the necessary commands from **Menu: Tools > Command Palette** or with **Ctrl+Shift+P** (Windows/Linux) **Cmd+Shift+P** (Mac) shortcut.
Command Hotkeys

Sublime Text allows one to bind own hotkey per command. Let’s setup them for PlatformIO commands using shortcut

Menu:  Preferences > Key-Bindings - User:
We are going to use these shortcuts:

- F11 for clean project
- F12 for upload firmware to target device

In this case, the final code will look like:

```
[{
  "keys": ["f11"],
  "command": "build",
  "args": {
    "variant": "Clean"
  }
},
{
  "keys": ["f12"],
  "command": "build",
  "args": {
    "variant": "Upload"
  }
}]
```

**First program in Sublime Text**

Simple “Blink” project will consist from two files:

1. Main “C” source file named `main.c` must be located in the `src` directory. Let’s create new file named `main.c` using Menu: File > New File or shortcut Ctrl+N (Windows/Linux) Cmd+N (Mac) with the next contents:

```c
#include "Arduino.h"
#define WLED 13 // Most Arduino boards already have an LED attached to pin 13 on the board itself

void setup()
{
  pinMode(WLED, OUTPUT); // set pin as output
}
```

(continues on next page)
void loop()
{
    digitalWrite(WLED, HIGH); // set the LED on
    delay(1000); // wait for a second
    digitalWrite(WLED, LOW); // set the LED off
    delay(1000); // wait for a second
}

2. Project Configuration File named platformio.ini must be located in the project root directory. Copy the source code which is described below to it.

```ini
; PlatformIO Project Configuration File
; Build options: build flags, source filter, extra scripting
; Upload options: custom port, speed and extra flags
; Library options: dependencies, extra library storages
;
; Please visit documentation for the other options and examples
; https://docs.platformio.org/page/projectconf.html

[env:arduino_uno]
platform = atmelavr
framework = arduino
board = uno
```

Conclusion

Taking everything into account, we can open project directory in Sublime Text using Menu: File > Open Folder and build it with shortcut Ctrl+B (Windows/Linux) or Cmd+B (Mac), clean project with shortcut F11 and upload firmware to target with shortcut F12.

Debugging

A debugging feature is provided by Debugging and new debug configuration named “PlatformIO Debugger“ is created. No need to do extra configuration steps!

1. Install SublimeGDB package
2. Launch debugger with F5
3. Wait for a while, PlatformIO will prepare project for debugging and session will be started soon.

Vim

Vim is an open-source, powerful and configurable text editor. Vim is designed for use both from a command-line interface and as a standalone application in a graphical user interface.
Integration

Integration process consists of these steps:

1. Open system Terminal and install PlatformIO Core (CLI)
2. Create new folder for your project and change directory (cd) to it
3. Generate a project using PlatformIO Core Project Generator (pio project init --ide)
4. Import project in IDE.
Project Generator

Choose board ID using `pio boards` or Embedded Boards Explorer command and generate project via `pio project init --ide` command:

```
pio project init --ide vim --board <ID>
```

Recommended bundles:

- C/C++/ObjC language server supporting cross references, hierarchies, completion and semantic highlighting
- Async language server protocol plugin for vim and neovim
- “Neomake-PlatformIO” Plugin

Put to the project directory Makefile wrapper with contents:

```
# Uncomment lines below if you have problems with $PATH
#SHELL := /bin/bash
#PATH := /usr/local/bin:$(PATH)

all:
    pio -f -c vim run

upload:
    pio -f -c vim run --target upload

clean:
    pio -f -c vim run --target clean

program:
    pio -f -c vim run --target program

uploadfs:
    pio -f -c vim run --target uploadfs

update:
    pio -f -c vim update
```

Pre-defined targets:

- **Build**: Build project without auto-uploading
- **Clean**: Clean compiled objects.
- **Upload**: Build and upload (if no errors)
- **Upload using Programmer** see *Upload using Programmer*
- **Upload SPIFFS image** see *Using Filesystem*
- **Update platforms and libraries** - Update installed platforms and libraries via `pio update`.

Now, in VIM `cd /path/to/this/project` and press Ctrl+B or Cmd+B (Mac). PlatformIO should compile your source code from the src directory, make firmware and upload it.

**Note**: If hotkey doesn’t work for you, try to add this line `nnoremap <C-b> :make<CR> to ~/.vimrc`

Visual Studio

The Microsoft Visual Studio (Free) is an integrated development environment (IDE) from Microsoft. Visual Studio includes a code editor supporting IntelliSense (the code completion component) as well as code refactoring.

Refer to the Visual Studio Documentation page for more detailed information.

Contents

- Visual Studio
  - Integration
    * Project Generator
    * Manual Integration
  - Setup New Project

1.19. Cloud & Desktop IDE 2697
Integration

Integration process consists of these steps:

1. Open system Terminal and install PlatformIO Core (CLI)
2. Create new folder for your project and change directory (cd) to it
3. Generate a project using PlatformIO Core Project Generator (pio project init --ide)
4. Import project in IDE.

Project Generator

Choose board ID using pio boards or Embedded Boards Explorer command and generate project via pio project init --ide command:

```bash
pio project init --ide visualstudio --board <ID>
```

# For example, generate project for Arduino UNO
pio project init --ide visualstudio --board uno

Then:

1. Import this project via Menu: File > Open > Project/Solution and specify root directory where is located “platformio.ini” (Project Configuration File)
2. Open source file from src directory (*.c, *.cpp, *.ino, etc.)

**Warning:** The libraries which are added, installed or used in the project after generating process won’t be reflected in IDE. To fix it you need to reinitialize project using pio project init (repeat it).

Manual Integration

Setup New Project

First of all, let’s create new project from Visual Studio Start Page: Start > New Project or using Menu: File > New > Project, then select project with Makefile type (Visual C++ > General > Makefile Project), fill Project name, Solution name, Location fields and press OK button.
Secondly, we need to configure project with PlatformIO Build System:
If we want to use native AVR programming, we have to specify additional preprocessor symbol (“Preprocessor definitions” field) about your MCU. For example, an Arduino Uno is based on the ATmega328 MCU. In this case we will add new definition `__AVR_ATmega328__`. 
Release Configuration is the same as Debug, so on the next step we check “Same as Debug Configuration” and click “Finish” button.
Thirdly, we need to add directories with header files using project properties (right click on the project name or Alt-Enter shortcut) and add two directories to Configuration Properties > NMake > Include Search Path:

```
$(HOMEDRIVE)$HOME\platformio\packages\toolchain-atmelavr\avr\include
$(HOMEDRIVE)$HOME\platformio\packages\framework-arduinoavr\cores\arduino
```
First program in Visual Studio

Simple “Blink” project will consist from two files:

1. Main “C++” source file named `main.cpp` must be located in the `src` directory. Let’s create new file named `main.cpp` using Menu: File > New File or shortcut Ctrl+N:
Copy the source code which is described below to file `main.cpp`.

```c
#include "Arduino.h"

void setup()
{
    pinMode(LED_BUILTIN, OUTPUT); // set pin as output
}

void loop()
{
    digitalWrite(LED_BUILTIN, HIGH); // set the LED on
    delay(1000); // wait for a second
    digitalWrite(LED_BUILTIN, LOW); // set the LED off
    delay(1000); // wait for a second
}
```

2. Project Configuration File named `platformio.ini` must be located in the project root directory.
Copy the source code which is described below to it.

```plaintext
; PlatformIO Project Configuration File
;
; Build options: build flags, source filter, extra scripting
; Upload options: custom port, speed and extra flags
; Library options: dependencies, extra library storages
;
; Please visit documentation for the other options and examples
; https://docs.platformio.org/page/projectconf.html

[env:arduino_uno]
platform = atmelavr
framework = arduino
board = uno
```

**Conclusion**

Taking everything into account, we can build project with shortcut Ctrl+Shift+B or using Menu: Build > Build Solution.

**Known issues**
IntelliSense Errors

VS Studio does not allow one to specify for project other toolchain which will be used by IntelliSense. In this case, IntelliSense does not understand GCC-specific definitions.

However, these errors does not have any influence on PlatformIO Build System. It means that you can ignore them and rely on PlatformIO Build System messages which will be shown in output console after build.

Nevertheless, you can provide an IntelliSense-friendly definition of problematic GCC constructs and make sure that the GCC will ignore such definitions or disable IntelliSense error reporting at all. See details in issue #543

VSCode

PlatformIO IDE is the next-generation integrated development environment for IoT.

- Cross-platform build system without external dependencies to the OS software:
  - 800+ Boards
  - 35+ Development Platforms
  - 20+ Frameworks
- Debugging
• Remote Development

• Unit Testing

• C/C++ Intelligent Code Completion

• C/C++ Smart Code Linter for rapid professional development

• Library Manager for the hundreds popular libraries

• Multi-projects workflow with multiple panes

• Themes support with dark and light colors

• Serial Port Monitor

• Built-in Terminal with PlatformIO Core (CLI) and CLI tool (pio, platformio)

• Built-in PlatformIO Home.

Visual Studio Code is a lightweight but powerful source code editor which runs on your desktop and is available for Windows, macOS and Linux. It comes with built-in support for JavaScript, TypeScript and Node.js and has a rich ecosystem of extensions for other languages (such as C++, C#, Python, PHP, Go) and runtimes (such as .NET and Unity)

Installation

Note: Please note that you do not need to install PlatformIO Core (CLI) separately if you are going to use VSCode. PlatformIO Core (CLI) is built into PlatformIO IDE and you will be able to use it within PlatformIO IDE Terminal.

0. Download and install official Microsoft Visual Studio Code. PlatformIO IDE is built on top of it
1. Open VSCode Package Manager
2. Search for the official platformio ide extension
3. Install PlatformIO IDE.
Quick Start

This tutorial introduces you to the basics of PlatformIO IDE workflow and shows you a creation process of a simple “Blink” example. After finishing you will have a general understanding of how to work with projects in the IDE.

Setting Up the Project

1. Click on “PlatformIO Home” button on the bottom PlatformIO Toolbar
2. Click on “New Project”, select a board and create new PlatformIO Project
3. Open `main.cpp` file form `src` folder and replace its contents with the next:

```cpp
Warning: The code below works only in pair with Arduino-based boards. Please follow to PlatformIO Project Examples repository for other pre-configured projects.

```cpp
/**
* Blink
*
* Turns on an LED on for one second,
* then off for one second, repeatedly.
*/
#include "Arduino.h"

// Set LED_BUILTIN if it is not defined by Arduino framework
// #define LED_BUILTIN 13

void setup()
{
    // initialize LED digital pin as an output.
    pinMode(LED_BUILTIN, OUTPUT);
} 
```
void loop()
{
    // turn the LED on (HIGH is the voltage level)
    digitalWrite(LED_BUILTIN, HIGH);

    // wait for a second
    delay(1000);

    // turn the LED off by making the voltage LOW
    digitalWrite(LED_BUILTIN, LOW);

    // wait for a second
    delay(1000);
}

4. Build your project with `ctrl+alt+b` hotkey (see all Key Bindings in “User Guide” section below) or using “Build” button on the \textit{PlatformIO Toolbar}
Further for reading:

- *Tutorials and Examples* (step-by-step tutorials with debugging and unit testing)
- Learn more about *PlatformIO Toolbar* and other commands (Upload, Clean, Serial Monitor) below.

**Happy coding with PlatformIO!**

**PlatformIO Toolbar**

PlatformIO IDE Toolbar is located in VSCode Status Bar (left corner) and contains quick access buttons for the popular commands. Each button contains hint (delay mouse on it).

1. *PlatformIO Home*
2. PlatformIO: Build
3. PlatformIO: Upload
4. PlatformIO: Clean
5. **Serial Port Monitor**

6. **PlatformIO Core (CLI)**

7. Project environment switcher (if more than one environment is available). See *Section [env] of “platformio.ini” (Project Configuration File)*.

**PlatformIO Core (CLI)**

There are 2 ways how to access **PlatformIO Core (CLI)**:

1. “Terminal” icon on the **PlatformIO Toolbar**

2. Left Activity Bar > PlatformIO (ant icon) > Quick Access > Miscellaneous > PlatformIO Core CLI

---

**Project Tasks**

**Task Explorer**

PlatformIO provides access to “Project Task” where you can control the build process of the environments declared in “platformio.ini” (*Project Configuration File*). Project Task Explorer is located in the VSCode Activity Bar under the branded PlatformIO icon. You can also access it via “VSCode Menu > Open View... > PlatformIO”.

**Hint:** Please note that you can drag/move “Project Task” into the another view within VSCode, such as “Explorer”.

---

2715
Task Runner

PlatformIO IDE provides built-in tasks through the menu Terminal > Run Task... (Build, Upload, Clean, Monitor, etc) and custom tasks per "platformio.ini" (Project Configuration File) environment ([env:***]). The default behavior is to use Terminal Panels for presentation, one panel dedicated to each unique task.

The PlatformIO IDE provides its own Problems Matcher named $platformio. You can use it later if you decide to change base task settings.

You can override existing tasks with your own presentation options. For example, let’s configure PlatformIO Task Runner to use a NEW Terminal panel for each “Build” command:

1. The menu item Terminal > Run Task... opens up a list of VSCode tasks for PlatformIO. In the line PlatformIO: Build, press the gear icon on the far right side of the list. This creates or opens the file .vscode/tasks.json with some template code.

2. Replace the template in tasks.json with this code
See more options in the official VSCode documentation.

## Custom Tasks

Custom tasks can be added to `tasks.json` file located in the `.vscode` folder in the root of project. Please read the official documentation [Tasks in VSCode](https://code.visualstudio.com/docs/editor/tasks).

This simple example demonstrates a custom monitor task which echoes input locally. There are a lot of other commands, please read more about [PlatformIO Core (CLI)](https://docs.platformio.org/projects/core-en) and its commands ([CLI Guide](https://docs.platformio.org/projects/core-en/)).

```json
{
    "version": "2.0.0",
    "tasks": [
        {
            "type": "shell",
            "command": "platformio",
            "args": [
                "device",
                "monitor",
                "--echo"
            ],
            "problemMatcher": [
                "$platformio"
            ],
            "label": "PlatformIO: Monitor (local echo)"
        }
    ]
}
```

If the `platformio` executable file is not in your system environment “PATH”, you can provide the full path to the binary folder using the `options` field for the task. For example, if the `platformio` binary is located in the home folder “~/.platformio/penv/bin”:

```json
{
    "version": "2.0.0",
    "tasks": [
        {
            "type": "shell",
            "command": "platformio",
            "args": [
                "device",
                "monitor",
                "--echo"
            ],
            "problemMatcher": [
                "$platformio"
            ],
            "label": "PlatformIO: Monitor (local echo)"
        }
    ]
}
```

(continues on next page)
Multi-project Workspaces

You can work with multiple project folders in Visual Studio Code with multi-root workspaces. This can be very helpful when you are working on several related projects at the same time. Read more in the documentation Multi-root Workspaces.

Serial Port Monitor

You can customize Serial Port Monitor using Monitor options in “platformio.ini” (Project Configuration File):

- **monitor_port**
- **monitor_speed**
- **monitor_rts**
- **monitor_dtr**
- **monitor_flags**

Example:

```ini
[env:esp32dev]
platform = espressif32
framework = arduino
board = esp32dev

; Custom Serial Monitor port
monitor_port = /dev/ttyUSB1

; Custom Serial Monitor speed (baud rate)
monitor_speed = 115200
```

Debugging

Debugging in VSCode works in combination with Debugging. You should have PlatformIO Account to work with it. VSCode has a separate activity view named “Debug” (accessed by the bug icon on the left toolbar). Debugging extends it with more advanced debugging instruments and features:
• Local, Global, and Static Variable Explorer
• Conditional Breakpoints
• Expressions and Watchpoints
• Generic Registers
• Peripheral Registers
• Memory Viewer
• Disassembly
• Multi-thread support
• A hot restart of an active debugging session.

There are two pre-configured debugging configurations:

**PIO Debug Default configuration.** PlatformIO runs the **Pre-Debug** task and builds the project using **Debug Configuration**. Also, it checks for project changes.

**PIO Debug (skip Pre-Debug)** PlatformIO skips the **Pre-Debug** stage and DOES NOT build or check the project for changes. If you do changes in project source files, they will not be reflected in debug sessions until you switch back to the “PIO Debug” configuration or manually run the “Pre-Debug” task.

This configuration is very useful for quick debug session. It is super fast by skipping several checks, letting you control project changes manually.

**Note:** Please note that **Debugging** will use the first declared build environment in “platformio.ini” (Project Configuration File) if the `default_envs` option is not specified.
Variable Format

Currently, VSCode does not provide an UI or API to change the variable format. See the related VSCode Issue #28025. A temporary solution is to set the default numerical base in which the debugger displays numeric output in the Debug Console. (The Debug Console is visible during active debugging sessions). For example, to show variables in hexadecimal format, copy the code below and paste it into “Debug Console”:

```
set output-radix 16
```

Possible values, listed in decimal base, are: 8, 10, 16.

Watchpoints

Please read GDB: Setting Watchpoints first.
Currently, VSCode does not provide an API to change the value format of watchpoints. You can manually cast watchpoint expressions to display the value as specific pointer types:

- \$pc, default decimal integer format
- 0x10012000, an address, default decimal integer format
- (void*)\$pc, \$pc register, hexadecimal format
- *(void**)0x10012000, an address, hexadecimal format

**Install Shell Commands**

Please refer to PlatformIO Core [Install Shell Commands](#).

**Proxy Server Support**

There are two options how to configure a proxy server:

1. Declare the `HTTP_PROXY` and `HTTPS_PROXY` system environment variables (for example `HTTP_PROXY=http://user:pass@10.10.1.10:3128/`, etc.)
2. Open VSCode Settings and search for “Proxy”. Please set “Http: Proxy” and disable “Http: Proxy Strict SSL”.

**Key Bindings**

- `ctrl+alt+b` / `cmd-shift-b` / `ctrl-shift-b` Build Project
- `cmd-shift-d` / `ctrl-shift-d` Debug project
- `ctrl+alt+u` Upload Firmware
- `ctrl+alt+s` Open Serial Port Monitor

You can override existing key bindings or add a new in VSCode. See official documentation [Key Bindings for Visual Studio Code](#).

**Settings**

How to configure VSCode settings?

**platformio-ide.activateOnlyOnPlatformIOProject**

If true, activate the platformio ide extension only when a PlatformIO-based project (that has a “platformio.ini” *(Project Configuration File)*) is open in the workspace. The default value is false.

**platformio-ide.autoCloseSerialMonitor**

If true, automatically close pio device monitor before uploading/testing. The default value is true.
platformio-ide.autoRebuildAutocompleteIndex

If true, automatically rebuild the C/C++ Project Index when “platformio.ini” (Project Configuration File) is changed or when new libraries are installed. The default value is true.

platformio-ide.buildTask

The build task (label) that is launched by the “Build” button in the PlatformIO Toolbar and Key Bindings. The default is PlatformIO: Build.

You can create custom Custom Tasks and assign one of them to platformio-ide.buildTask.

platformio-ide.autoPreloadEnvTasks

Automatically preload ALL project environment tasks. The default value is false.

platformio-ide.customPATH

Custom PATH for the platformio command. Paste here the result of echo $PATH (Unix) / echo %PATH% (Windows) command by typing into your system terminal if you prefer to use a custom version of PlatformIO Core (CLI). The default value is null, meaning PlatformIO looks for the platformio command in the system path.

platformio-ide.disableToolbar

Disable the PlatformIO toolbar. The default value is false.

platformio-ide.forceUploadAndMonitor

If true, the Upload (platformio-ide.upload) command is changed to use the “Upload and Monitor” task. The default value is false.

platformio-ide.reopenSerialMonitorDelay

Configure the time in milliseconds before reopening the Serial Port Monitor. The default value is 0, which means to reopen instantly.

platformio-ide.useBuiltinPython

Use a portable Python 3 Interpreter if available. The default value is true.

platformio-ide.useBuiltinPIOCore

If true, use the built-in PlatformIO Core (CLI). The default value is true.
platformio-ide.useDevelopmentPIOCore

If true, use the development version of PlatformIO Core (CLI). The default value is false.

platformio-ide.disablePIOHomeStartup

Disable showing PlatformIO Home at startup. The default value is false.

platformio-ide.pioHomeServerHttpPort

PlatformIO Home server HTTP port. The default value 0 automatically assigns a free port in the range [8010..8100]).

Known issues

PackageManager is unable to install tool

This is a known bug in VSCode Terminal issue #61.

A temporary solution is to install packages using a system terminal (not VSCode Terminal). Please use “Solution 3: Run from Terminal” in FAQ > Package Manager > [Error 5] Access is denied. Afterwards, go back to using the VSCode Terminal.

Changelog

Please visit the releases page.

1.20 Continuous Integration

Continuous Integration (CI, wiki) is the practice, in software engineering, of merging all developer working copies with a shared mainline several times a day.

pio ci command is intended to be used in combination with the build servers and the popular Continuous Integration Software.

By integrating regularly, you can detect errors quickly, and locate them more easily.

1.20.1 AppVeyor

AppVeyor is an open-source hosted, distributed continuous integration service used to build and test projects hosted at GitHub on Windows family systems.

AppVeyor is configured by adding a file named appveyor.yml, which is a YAML format text file, to the root directory of the GitHub repository.

AppVeyor automatically detects when a commit has been made and pushed to a repository that is using AppVeyor, and each time this happens, it will try to build the project using pio ci command. This includes commits to all branches, not just to the master branch. AppVeyor will also build and run pull requests. When that process has completed, it will notify a developer in the way it has been configured to do so — for example, by sending an email containing the build results (showing success or failure), or by posting a message on an IRC channel. It can be configured to build project on a range of different Development Platforms.
Integration

Put appveyor.yml to the root directory of the GitHub repository. The contents of this file depends on the project you want to add. There are two possible ways of running PlatformIO in CI services:

Using pio run command

This variant is default choice for native PlatformIO projects:

```yaml
build: off
environment:

install:
  - cmd: git submodule update --init --recursive
  - cmd: SET PATH=%PATH%;C:\Python27\Scripts
  - cmd: pip install -U platformio

test_script:
  - cmd: pio run -e <ID_1> -e <ID_2> -e <ID_N>
```

Using pio ci command

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

```yaml
build: off
environment:

matrix:
  - PLATFORMIO_CI_SRC: "path\to\source\file.c"
  - PLATFORMIO_CI_SRC: "path\to\source\file.ino"
  - PLATFORMIO_CI_SRC: "path\to\source\directory"

install:
  - cmd: git submodule update --init --recursive
  - cmd: SET PATH=%PATH%;C:\Python27\Scripts
  - cmd: pip install -U platformio

test_script:
  - cmd: pio ci --board=<ID_1> --board=<ID_2> --board=<ID_N>
```
Examples

1. Integration for USB_Host_Shield_2.0 project. The appveyor.yml configuration file:

```yaml
build: off
environment:

  matrix:
    - PLATFORMIO_CI_SRC: "examples\Bluetooth\PS3SPP\PS3SPP.ino"
    - PLATFORMIO_CI_SRC: "examples\pl2303\pl2303_gps\pl2303_gps.ino"

install:
  - cmd: git submodule update --init --recursive
  - cmd: SET PATH=%PATH%;C:\Python27\Scripts
  - cmd: pip install -U platformio
  - cmd: git clone https://github.com/xxxajk/spi4teensy3.git C:\spi4teensy

test_script:
  - cmd: pio ci --lib="." --lib="C:\spi4teensy" --board=uno --board=teensy31 --
     --board=due
```

1.20.2 CircleCI

CircleCI is a hosted cloud platform that provides hosted continuous integration, deployment, and testing to GitHub repositories.

CircleCI is configured by adding a file named circle.yml, which is a YAML format text file, to the root directory of the GitHub repository.

CircleCI automatically detects when a commit has been made and pushed to a repository that is using CircleCI, and each time this happens, it will try to build the project using pio ci command. This includes commits to all branches, not just to the master branch. CircleCI will also build and run pull requests. When that process has completed, it will notify a developer in the way it has been configured to do so — for example, by sending an email containing the build results (showing success or failure), or by posting a message on an IRC channel. It can be configured to build project on a range of different Development Platforms.

Contents

- CircleCI
  - Integration
    - Using pio run command
    - Using pio ci command
      - Library dependencies
    - Install dependent library using Library Management
    - Manually download dependent library and include in build process via --lib option
      - Custom Build Flags
      - Advanced configuration
  - Examples
Integration

Note: Please make sure to read CircleCI Getting Started guide first.

There are two possible ways of running PlatformIO in CI services:

**Using pio run command**

This variant is default choice for native PlatformIO projects:

```
dependencies:
  pre:
    # Install the latest stable PlatformIO
    - sudo pip install -U platformio
  test:
    override:
    - pio run -e <ID_1> -e <ID_2> -e <ID_N>
```

**Using pio ci command**

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

```
dependencies:
  pre:
    # Install the latest stable PlatformIO
    - sudo pip install -U platformio
  test:
    override:
    - pio ci path/to/test/file.c --board=<ID_1> --board=<ID_2> --board=<ID_N>
    - pio ci examples/file.ino --board=<ID_1> --board=<ID_2> --board=<ID_N>
    - pio ci path/to/test/directory --board=<ID_1> --board=<ID_2> --board=<ID_N>
```

**Library dependencies**

There 2 options to test source code with dependent libraries:

**Install dependent library using Library Management**

```
dependencies:
  pre:
    # Install the latest stable PlatformIO
    - sudo pip install -U platformio
    # OneWire Library with ID=1 https://platformio.org/lib/show/1/OneWire
    - pio lib -g install 1
```

(continues on next page)
test:
  override:
    - pio ci path/to/test/file.c --board=<ID_1> --board=<ID_2> --board=<ID_N>

Manually download dependent library and include in build process via \texttt{--lib} option

dependencies:
  pre:
    # Install the latest stable PlatformIO
    - sudo pip install -U platformio
    # download library to the temporary directory
    - wget https://github.com/PaulStoffregen/OneWire/archive/master.zip -O /tmp/onewire_source.zip
      - unzip /tmp/onewire_source.zip -d /tmp/
  test:
    override:
      - pio ci path/to/test/file.c --lib="/tmp/OneWire-master" --board=<ID_1> --board=<ID_2> --board=<ID_N>

Custom Build Flags

PlatformIO allows one to specify own build flags using \texttt{PLATFORMIO\_BUILD\_FLAGS} environment

machine:
  environment:
    \texttt{PLATFORMIO\_BUILD\_FLAGS}: \texttt{-D \texttt{SPECIFIC\_MACROS} -I/extra/inc}

For the more details, please follow to available build flags/options.

Advanced configuration

PlatformIO allows one to configure multiple build environments for the single source code using \texttt{“platformio.ini” (Project Configuration File)}.

Instead of \texttt{--board} option, please use \texttt{pio ci \texttt{--project-conf}}

Example:

1. Custom build flags

dependencies:
  cachedirectories:
    - "~/.platformio"
PlatformIO Documentation, Release 5.0.5a1

(continued from previous page)

pre:

- sudo pip install -U platformio
  
  # pre-install PlatformIO development platforms, they will be cached
  - pio platform install atmelavr atmelsam teensy

  #
  # Libraries from PlatformIO Library Registry:
  #
  # https://platformio.org/lib/show/416/TinyGPS
  # https://platformio.org/lib/show/417/SPI4Teensy3
  - pio lib -g install 416 417

  
  test:

  override:

  pio ci examples/acm/acm_terminal --board=uno --board=teensy31 --board=due --
  --lib="."
  - pio ci examples/adk/adk_barcode --board=uno --board=teensy31 --board=due --
  --lib="."
  - pio ci examples/adk/ArduinoBlinkLED --board=uno --board=teensy31 --
    --board=due --lib="."
  - pio ci examples/adk/demokit_20 --board=uno --board=teensy31 --board=due --
    --lib="."
    # ...
    # pio ci examples/Xbox/XBOXUSB --board=uno --board=teensy31 --board=due --
    --lib="."

2. Dependency on external libraries

dependencies:

pre:

  # Install the latest stable PlatformIO
  - sudo pip install -U platformio

  # download dependent libraries
  - wget https://github.com/jcw/jeelib/archive/master.zip -O /tmp/jeelib.zip
    - unzip /tmp/jeelib.zip -d /tmp
    - unzip /tmp/gamebuino.zip -d /tmp

  # ...
  
  test:

  override:

  - pio ci examples/backSoon/backSoon.ino --lib="."
    --lib="/tmp/jeelib-master"
    --lib="/tmp/Gamebuino-master/libraries/tinyFAT"
    --board=uno --board=megaatmega2560

  - pio ci examples/etherNode/etherNode.ino --lib="."
    --lib="/tmp/jeelib-master"
    --lib="/tmp/Gamebuino-master/libraries/tinyFAT"
    --board=uno --board=megaatmega2560

  # ...

(continues on next page)
1.20.3 Drone

Drone is a hosted continuous integration service. It enables you to conveniently set up projects to automatically build, test, and deploy as you make changes to your code to GitHub and BitBucket repositories.

Drone is configured by modifying settings in your project control panel.

Drone automatically detects when a commit has been made and pushed to a repository that is using Drone, and each time this happens, it will try to build the project using `pio ci` command. This includes commits to all branches, not just to the master branch. Drone will also build and run pull requests. When that process has completed, it will notify a developer in the way it has been configured to do so — for example, by sending an email containing the build results (showing success or failure). It can be configured to build project on a range of different Development Platforms.

### Contents

- **Drone**
  - Integration
    - Using `pio run` command
    - Using `pio ci` command
  - Examples

### Integration

There are two possible ways of running PlatformIO in CI services:

#### Using `pio run` command

This variant is default choice for native PlatformIO projects (Please fill all fields for your project in the Drone control panel):

**Commands:**

```
pip install -U platformio
pio run -e <ID_1> -e <ID_2> -e <ID_N>
```
Using pio ci command

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

Environment Variables:

- `PLATFORMIO_CI_SRC=path/to/source/file.c`
- `PLATFORMIO_CI_SRC=path/to/source/file.ino`
- `PLATFORMIO_CI_SRC=path/to/source/directory`

Commands:

- `pip install -U platformio`
- `pio ci --board=<ID_1> --board=<ID_2> --board=<ID_N>`
Examples

1. Integration for USB_Host_Shield_2.0 project. The `circle.yml` configuration file:

   Environment Variables:

   ```
   PLATFORMIO_CI_SRC=examples/Bluetooth/PS3SPP/PS3SPP.ino
   PLATFORMIO_CI_SRC=examples/pl2303/pl2303_gps/pl2303_gps.ino
   ```

   Commands:
1.20.4 GitHub Actions

GitHub Actions enables you to create custom software development life cycle (SDLC) workflows directly in your
GitHub repository.

You need to configure GitHub Actions using YAML syntax, and save them as workflow files in your repository. Workflows are custom automated processes that you can set up in your repository to build, test, package, release, or deploy any code project on GitHub. You can write individual tasks, called actions, and combine them to create a custom workflow. Once you’ve successfully created a YAML workflow file and triggered the workflow, you will see the build logs, tests results, artifacts, and statuses for each step of your workflow. It can be configured to build project on a range of different Development Platforms.

GitHub Actions help you automate your software development workflows in the same place you store code and collaborate on pull requests and issues and each time this happens, it will try to build the project using pio ci command.

## Contents

- **GitHub Actions**
  - Integration
    * Using pio run command
    * Using pio ci command
      - Library dependencies
    * Install dependent library using Library Management
    * Manually download dependent library and include in build process via --lib option
      - Custom Build Flags
    - Examples

## Integration

**Note:** Please make sure to read GitHub Actions Getting Started guide first.

There are two possible ways of running PlatformIO in CI services:

### Using pio run command

This variant is default choice for native PlatformIO projects:

```yaml
name: PlatformIO CI

on: [push]

jobs:
  build:
    runs-on: ubuntu-latest
    steps:
      - uses: actions/checkout@v2
      - name: Cache pip
        uses: actions/cache@v2

```

(continues on next page)
with:
  path: ~/.cache/pip
  key: ${{ runner.os }}-pip-{{ hashFiles('**/requirements.txt') }}
  restore-keys: |
    ${{ runner.os }}-pip-
  - name: Cache PlatformIO
    uses: actions/cache@v2
    with:
      path: ~/.platformio
      key: ${{ runner.os }}-{{ hashFiles('**/lockfiles') }}
      restore-keys: ${{ runner.os }}-platformio-
  - name: Set up Python
    uses: actions/setup-python@v2
  - name: Install PlatformIO
    run: |
      python -m pip install --upgrade pip
      pip install --upgrade platformio
  - name: Run PlatformIO
    run: pio run -e <ID_1> -e <ID_2> -e <ID_N>

Using pio ci command

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

```yaml
name: PlatformIO CI

on: [push]

jobs:
  build:
    runs-on: ubuntu-latest
    strategy:
      matrix:
        example: [path/to/test/file.c, examples/file.ino, path/to/test/directory]

    steps:
    - uses: actions/checkout@v2
    - name: Cache pip
      uses: actions/cache@v2
      with:
        path: ~/.cache/pip
        key: ${{ runner.os }}-pip-{{ hashFiles('**/requirements.txt') }}
        restore-keys: ${{ runner.os }}-pip-
    - name: Cache PlatformIO
      uses: actions/cache@v2
      with:
        path: ~/.platformio
        key: ${{ runner.os }}-{{ hashFiles('**/lockfiles') }}
        restore-keys: ${{ runner.os }}-platformio-
    - name: Set up Python
      uses: actions/setup-python@v2
    - name: Install PlatformIO
      run: |
        python -m pip install --upgrade pip
        pip install --upgrade platformio
```

(continues on next page)
- name: Run PlatformIO
  run: pio ci --board=<ID_1> --board=<ID_2> --board=<ID_N>
  env:
    PLATFORMIO_CI_SRC: ${{ matrix.example }}

Library dependencies

There are two options to test source code with dependent libraries:

Install dependent library using Library Management

- name: Install library dependencies
  run: pio lib -g install 1

- name: Run PlatformIO
  run: pio ci path/to/test/file.c --board=<ID_1> --board=<ID_2> --board=<ID_N>

Manually download dependent library and include in build process via --lib option

- name: Install library dependencies
  run: |
    wget https://github.com/PaulStoffregen/OneWire/archive/master.zip -O /tmp/onewire_source.zip
    unzip /tmp/onewire_source.zip -d /tmp/

- name: Run PlatformIO
  run: pio ci path/to/test/file.c --lib="/tmp/OneWire-master" --board=<ID_1> --board=<ID_2> --board=<ID_N>

Custom Build Flags

PlatformIO allows one to specify own build flags using PLATFORMIO_BUILD_FLAGS environment

- name: Run PlatformIO
  run: pio ci path/to/test/file.c --lib="/tmp/OneWire-master" --board=<ID_1> --board=<ID_2> --board=<ID_N>
  env:
    PLATFORMIO_BUILD_FLAGS: -D SPECIFIC_MACROS -I/extra/inc

For the more details, please follow to available build flags/options.

Examples

Integration for USB_Host_Shield_2.0 project. The workflow.yml configuration file:

name: PlatformIO CI

on: [push]
jobs:
  build:
    runs-on: ${{ matrix.os }}
    strategy:
      matrix:
        os: [ubuntu-latest, macos-latest, windows-latest]
        example: [examples/Bluetooth/PS3SPP/PS3SPP.ino, examples/pl2303/pl2303_gps/pl2303_gps.ino]
    steps:
      - uses: actions/checkout@v2
      - name: Cache pip
        uses: actions/cache@v2
        with:
          path: ~/.cache/pip
          key: ${{ runner.os }}-pip-${{ hashFiles('**/requirements.txt') }}
          restore-keys:
            - ${{ runner.os }}-pip-
      - name: Cache PlatformIO
        uses: actions/cache@v2
        with:
          path: ~/.platformio
          key: ${{ runner.os }}-${{ hashFiles('**/lockfiles') }}
      - name: Set up Python
        uses: actions/setup-python@v2
      - name: Install PlatformIO
        run: |
          python -m pip install --upgrade pip
          pip install --upgrade platformio
          unzip /tmp/spi4teensy3.zip -d /tmp
          pio ci --lib="." --lib="/tmp/spi4teensy3-master" --board=uno --board=teensy31 --board=due
          env:
            PLATFORMIO_CI_SRC: ${{ matrix.example }}

1.20.5 GitLab

GitLab is a hosted cloud platform that can help you build, test, deploy, and monitor your code from GitLab repositories. GitLab CI is enabled by default on new projects, so you can start using its features right away. All you need is `pio ci` command, a file called `.gitlab-ci.yml` (where you describe how the build should run) placed in the root directory of your git project, and a configured Runner to perform the actual build (Gitlab has some pre-configured public runners so your CI script should work out of the box). Each project comes with a Builds page where you can follow the output of each build, see the commit that introduced it and other useful information such as the time the build started, how long it lasted and the committer’s name. The statuses for each build are exposed in the GitLab UI, and you can see whether a build succeeded, failed, got canceled or skipped.
Integration

Put .gitlab-ci.yml to the root directory of your repository. The contents of this file depends on the project you want to add. There are two possible ways of running PlatformIO in CI services:

Using pio run command

This variant is default choice for native PlatformIO projects:

```yaml
image: python:2.7
stages:
  - test
before_script:
  - "pip install -U platformio"
job:
  stage: test
  script: "pio run -e <ID_1> -e <ID_2> -e <ID_N>"
```

Using pio ci command

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

```yaml
image: python:2.7
stages:
  - test
before_script:
  - "pip install -U platformio"
job:
  stage: test
  script: "pio ci --board=<ID_1> --board=<ID_2> --board=<ID_N>"
  variables: {
    PLATFORMIO_CI_SRC: "path/to/test/file.c"
  }
```
Examples

1. Integration for ArduinoJson library project. The .gitlab-ci.yml configuration file:

```
image: python:2.7

stages:
- test

.job_template: &pio_run
  script:
    - "pio ci --lib='.' --board=uno --board=teensy31 --board=nodemcu
      --$PLATFORMIO_CI_EXTRA_ARGS"

before_script:
  - "pip install -U platformio"

JsonGeneratorExample:
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/JsonGeneratorExample

JsonHttpClient:
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/JsonHttpClient

JsonParserExample:
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/JsonParserExample

JsonServer:
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/JsonServer

JsonUdpBeacon:
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/JsonUdpBeacon

ProgmemExample:
  stage: test
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/ProgmemExample

StringExample:
  stage: test
  <<: *pio_run
  variables:
    PLATFORMIO_CI_SRC: examples/StringExample
```
1.20.6 Jenkins

Jenkins is a self-contained, open source automation server which can be used to automate all sorts of tasks related to building, testing, and deploying software.

Jenkins can be installed through native system packages, Docker, or even run standalone by any machine with a Java Runtime Environment (JRE) installed.

It can be configured to build project on a range of different Development Platforms.

Contents

- Jenkins
  - Integration

Integration

See step-by-step guide in ThingForward’s blog post Setting up a Jenkins CI engine for embedded projects.

1.20.7 Shippable

Shippable is a hosted cloud platform that provides hosted continuous integration, deployment, and testing to GitHub and BitBucket repositories. Shippable’s continuous integration service is built using Docker.

Shippable is configured by adding a file named shippable.yml, which is a YAML format text file, to the root directory of the GitHub repository or you can use your Travis CI configuration file .travis.yml.

Shippable automatically detects when a commit has been made and pushed to a repository that is using Shippable, and each time this happens, it will try to build the project using pio ci command. This includes commits to all branches, not just to the master branch. Shippable will also build and run pull requests. When that process has completed, it will notify a developer in the way it has been configured to do so — for example, by sending an email containing the build results (showing success or failure), or by posting a message on an IRC channel. It can be configured to build project on a range of different Development Platforms.

Contents

- Shippable
  - Integration
    - Using pio run command
    - Using pio ci command
  - Examples

Integration

Put shippable.yml or .travis.yml to the root directory of your repository. The contents of this file depends on the project you want to add. There are two possible ways of running PlatformIO in CI services:
Using pio run command

This variant is default choice for native PlatformIO projects:

```yaml
language: python
python:
  - "2.7"
install:
  - pip install -U platformio
script:
  - pio run -e <ID_1> -e <ID_2> -e <ID_N>
```

Using pio ci command

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

```yaml
language: python
python:
  - "2.7"
env:
  - PLATFORMIO_CI_SRC=path/to/source/file.c
  - PLATFORMIO_CI_SRC=path/to/source/file.ino
  - PLATFORMIO_CI_SRC=path/to/source/directory
install:
  - pip install -U platformio
script:
  - pio ci --board=<ID_1> --board=<ID_2> --board=<ID_N>
```

Examples

1. Integration for USB_Host_Shield_2.0 project. The shippable.yml or .travis.yml configuration file:

```yaml
language: python
python:
  - "2.7"
env:
  - PLATFORMIO_CI_SRC=examples/Bluetooth/PS3SPP/PS3SPP.ino
  - PLATFORMIO_CI_SRC=examples/pl2303/pl2303_gps/pl2303_gps.ino
install:
  - pip install -U platformio
  - unzip /tmp/spi4teensy3.zip -d /tmp
script:
  - pio ci --lib="." --lib="/tmp/spi4teensy3-master" --board=uno --board=teensy31 --board=due
```
1.20.8 Travis CI

Travis CI officially supports PlatformIO for Embedded Builds.

Travis CI is an open-source hosted, distributed continuous integration service used to build and test projects hosted at GitHub.

Travis CI is configured by adding a file named `.travis.yml`, which is a YAML format text file, to the root directory of the GitHub repository.

Travis CI automatically detects when a commit has been made and pushed to a repository that is using Travis CI, and each time this happens, it will try to build the project using `pio ci` command. This includes commits to all branches, not just to the master branch. Travis CI will also build and run pull requests. When that process has completed, it will notify a developer in the way it has been configured to do so — for example, by sending an email containing the build results (showing success or failure), or by posting a message on an IRC channel. It can be configured to build project on a range of different Development Platforms.

Contents

- Travis CI
  - Integration
    * Using pio run command
    * Using pio ci command
  - Library dependencies
    * Install dependent library using Library Management
    * Manually download dependent library and include in build process via `--lib` option
  - Custom Build Flags
  - Advanced configuration
  - Unit Testing
  - Examples

Integration

Please make sure to read Travis CI Getting Started and general build configuration guides first.

Note: If you are going to use PlatformIO Unit Testing or Remote Development you will need to define `PLATFORMIO_AUTH_TOKEN` environment variable in project settings. See Defining Variables in Repository Set-
PlatformIO is written in Python and is recommended to be run within Travis CI Python isolated environment. There are two possible ways of running PlatformIO in CI services:

Using pio run command

This variant is default choice for native PlatformIO projects:

```yaml
language: python
python: - "3.7"

# Cache PlatformIO packages using Travis CI container-based infrastructure
sudo: false
cache:
  directories:
    - "~/.platformio"
    - $HOME/.cache/pip
install:
  - pip install -U platformio
  - pio update
script:
  - pio run -e <ID_1> -e <ID_2> -e <ID_N>
```

Using pio ci command

This variant is more convenient when project is written as a library (when there are examples or testing code) as it has additional options for specifying extra libraries and boards from command line interface:

```yaml
language: python
python: - "3.7"

# Cache PlatformIO packages using Travis CI container-based infrastructure
sudo: false
cache:
  directories:
    - "~/.platformio"
    - $HOME/.cache/pip

env:
  - PLATFORMIO_CI_SRC=path/to/test/file.c
  - PLATFORMIO_CI_SRC=examples/file.ino
  - PLATFORMIO_CI_SRC=path/to/test/directory

install:
  - pip install -U platformio
  - pio update

script:
  - pio ci --board=<ID_1> --board=<ID_2> --board=<ID_N>
```
Then perform steps 1, 2 and 4 from http://docs.travis-ci.com/user/getting-started/

Library dependencies

There are 2 options to test source code with dependent libraries:

Install dependent library using Library Management

```
install:
  - pip install -U platformio
  
  # Libraries from PlatformIO Library Registry:
  
  # https://platformio.org/lib/show/1/OneWire
  - pio lib -g install 1
```

Manually download dependent library and include in build process via --lib option

```
install:
  - pip install -U platformio
  
  # download library to the temporary directory
  - wget https://github.com/PaulStoffregen/OneWire/archive/master.zip -O /tmp/onewire_source.zip
  - unzip /tmp/onewire_source.zip -d /tmp/

script:
  - pio ci --lib="/tmp/OneWire-master" --board=<ID_1> --board=<ID_2> --board=<ID_N>
```

Custom Build Flags

PlatformIO allows one to specify own build flags using `PLATFORMIO_BUILD_FLAGS` environment

```
env:
  - PLATFORMIO_CI_SRC=path/to/test/file.c PLATFORMIO_BUILD_FLAGS="-D SPECIFIC MACROS_PER_TEST_ENV -I/extra/inc"
  - PLATFORMIO_CI_SRC=examples/file.ino
  - PLATFORMIO_CI_SRC=path/to/test/directory

install:
  - pip install -U platformio
  
  export PLATFORMIO_BUILD_FLAGS="-D GLOBAL_MACROS_FOR_ALL_TEST_ENV"
```

For the more details, please follow to available build flags/options.

Advanced configuration

PlatformIO allows one to configure multiple build environments for the single source code using “platformio.ini” (Project Configuration File).

Instead of --board option, please use `pio ci --project-conf`
Unit Testing

See PlatformIO Remote Unit Testing Example.

Examples

1. Custom build flags

```yaml
language: python
python:
  - "3.7"

# Cache PlatformIO packages using Travis CI container-based infrastructure
sudo: false
cache:
  directories:
    - "~/.platformio"
    - $HOME/.cache/pip

env:
  - PLATFORMIO_CI_SRC=examples/acm/acm_terminal
  - PLATFORMIO_CI_SRC=examples/Bluetooth/WiiIRCamera PLATFORMIO_BUILD_FLAGS="-DWIIICAMERA"
  - PLATFORMIO_CI_SRC=examples/ftdi/USBFTDILoopback
  - PLATFORMIO_CI_SRC=examples/Xbox/XBOXUSB
    # - ...

install:
  - pip install -U platformio
  - pio update

# Libraries from PlatformIO Library Registry:
# https://platformio.org/lib/show/416/TinyGPS
# https://platformio.org/lib/show/417/SPI4Teensy3
  - pio lib -g install 416 417

script:
  - pio ci --board=uno --board=teensy3l --board=due --lib="."
```

- Configuration file: https://github.com/felis/USB_Host_Shield_2.0/blob/master/.travis.yml
- Build History: https://travis-ci.org/felis/USB_Host_Shield_2.0

2. Dependency on external libraries

```yaml
language: python
python:
  - "3.7"

# Cache PlatformIO packages using Travis CI container-based infrastructure
(continues on next page)
sudo: false

cache:
  directories:
    - "~/.platformio"
    - $HOME/.cache/pip

env:
  - PLATFORMIO_CI_SRC=examples/backSoon/backSoon.ino
  - PLATFORMIO_CI_SRC=examples/etherNode/etherNode.ino

install:
  - pip install -U platformio
  - pio update

  - wget https://github.com/jcw/jeelib/archive/master.zip -O /tmp/jeelib.zip
  - unzip /tmp/jeelib.zip -d /tmp

  - unzip /tmp/gamebuino.zip -d /tmp

script:
  - pio ci --lib="." --lib="/tmp/jeelib-master" --lib="/tmp/Gamebuino-master/
  - board=uno --board=megaatmega2560

  • Configuration file: https://github.com/jcw/ethercard/blob/master/.travis.yml
  • Build History: https://travis-ci.org/jcw/ethercard

  3. Dynamic testing of the boards

language: python

python:
  - "3.7"

# Cache PlatformIO packages using Travis CI container-based infrastructure

# sudo: false

cache:
  directories:
    - "~/.platformio"
    - $HOME/.cache/pip

env:
  - PLATFORMIO_CI_SRC=examples/TimeArduinoDue PLATFORMIO_CI_EXTRA_ARGS="--board=due"
  - PLATFORMIO_CI_SRC=examples/TimeGPS
  - PLATFORMIO_CI_SRC=examples/TimeNTP
  - PLATFORMIO_CI_SRC=examples/TimeTeensy3 PLATFORMIO_CI_EXTRA_ARGS="--board=teensy31"
# ...

install:
  - pip install -U platformio
  - pio update
  - rm -rf ./linux
# (continues on next page)
# Libraries from PlatformIO Library Registry:
- https://platformio.org/lib/show/416/TinyGPS
- pio lib -g install 416 421 422

script:
- pio ci --lib="." --board=uno --board=teensy20pp $PLATFORMIO_CI_EXTRA_ARGS

- Configuration file: https://github.com/ivankravets/Time/blob/master/.travis.yml
- Build History: https://travis-ci.org/ivankravets/Time

4. Advanced configuration with extra project options and libraries

```yaml
language: python
python:
  - "3.7"

# Cache PlatformIO packages using Travis CI container-based infrastructure
sudo: false
cache:
  directories:
    - "~/.platformio"
    - "$HOME/.cache/pip

env:
- PLATFORMIO_CI_SRC=examples/Boards_Bluetooth/Adafruit_Bluefruit_LE PLATFORMIO_CI_EXTRA_ARGS="--board=genuino101"
- PLATFORMIO_CI_SRC=examples/Boards_Bluetooth/Arduino_101_BLE PLATFORMIO_CI_EXTRA_ARGS="--board=bluepill_f103c8 --project-option='framework=arduino'"
- PLATFORMIO_CI_SRC=examples/Boards_USB_Serial/Blue_Pill_STM32F103C PLATFORMIO_CI_EXTRA_ARGS="--board=bluepill_f103c8 --project-option='framework=arduino'"
- PLATFORMIO_CI_SRC=examples/Export_Demo/myPlant_ESP8266 PLATFORMIO_CI_EXTRA_ARGS="--board=nodemcu2 --project-option='lib_ignore=WiFi101'"
- ...

install:
- pip install -U platformio
- pio update

# Libraries from PlatformIO Library Registry:

- https://platformio.org/lib/show/44/Time
- https://platformio.org/lib/show/419/SimpleTimer
- https://platformio.org/lib/show/17/Adafruit-CC3000
- https://platformio.org/lib/show/28/SPI4Teensy3
- https://platformio.org/lib/show/91/UIPEthernet
- https://platformio.org/lib/show/418/WildFireCore
- https://platformio.org/lib/show/420/WildFire-CC3000
- https://platformio.org/lib/show/65/WiFlyHQ
- https://platformio.org/lib/show/19/Adafruit-DHT
- https://platformio.org/lib/show/299/WiFi101
- https://platformio.org/lib/show/259/BLEPeripheral
- https://platformio.org/lib/show/177/Adafruit_BluefruitLE_nRF51
```

(continues on next page)

**script:**
- make travis-build

- Configuration file: https://github.com/blynkkk/blynk-library/blob/master/.travis.yml
- Build History: https://travis-ci.org/blynkkk/blynk-library

### 1.21 Compilation database compile_commands.json

A compilation database is a JSON-formatted file named `compile_commands.json` that contains structured data about every compilation unit in your project. **PlatformIO Core (CLI)** supports generating of compilation database using `pio run --target` command and `compiledb` target. For example,

```
> pio run -t compiledb
```

A default path for `compile_commands.json` is “`build_dir/envname`”. You can override this path with `Advanced Scripting` and `COMPILATIONDB_PATH` environment variable. For example, generate `compile_commands.json` in a root of project:

```
platformio.ini:

[env:myenv]
platform = ...
board = ...
extra_scripts = post:extra_script.py
```

```
extra_script.py:

import os
Import("env")

env.Replace(COMPILATIONDB_PATH=os.path.join("$PROJECT_DIR", "compile_commands.json"))
```

### 1.22 Articles about us

**Note:** If you’ve written article about PlatformIO and would like it listed on this page, please edit this page.

Here are recent articles/reviews about PlatformIO:

    • UnicodeDecodeError: Non-ASCII characters found in build environment
1.23.1 General

What is PlatformIO?

Please refer to What is PlatformIO?

What is .pio directory

Please refer to workspace_dir.

What is .pioenvs directory

Please refer to build_dir.

Command completion in Terminal

Please refer to PlatformIO Shell Completion.

1.23.2 Install Python Interpreter

PlatformIO Core (CLI) is written in Python that is installed by default on the all popular OS except Windows. Please navigate to official website and Download the latest Python and install it. Please READ NOTES BELOW.

macOS Please read the “Important Information” displayed during installation for information about SSL/TLS certificate validation and the running the “Install Certificates.command”.

If you do not install SSL/TLS certificates, PlatformIO will not be able to download dependent packages, libraries, and toolchains.

Windows Please select Add Python to Path (see below), otherwise, python command will not be available.
1.23.3 Convert Arduino file to C++ manually

Some Cloud & Desktop IDE doesn’t support Arduino files (*.ino and .pde) because they are not valid C/C++ based source files:

1. Missing includes such as `#include <Arduino.h>`
2. Function declarations are omitted.

In this case, code completion and code linting do not work properly or are disabled. To avoid this issue you can manually convert your INO files to CPP.

For example, we have the next Demo.ino file:

```cpp
void setup () {
    someFunction(13);
}

void loop () {
    delay(1000);
}

void someFunction(int num) {
}
```

Let’s convert it to Demo.cpp:

1. Add `#include <Arduino.h>` at the top of the source file
2. Declare each custom function (excluding built-in, such as `setup` and `loop`) before it will be called.

The final Demo.cpp:

```cpp
#include <Arduino.h>

void someFunction(int num);
```

(continues on next page)
void setup () {
    someFunction(13);
}

void loop () {
    delay(1000);
}

void someFunction(int num) {
}

Finish.

1.23.4 Program Memory Usage

PlatformIO calculates firmware/program memory usage based on the next segments:

- **.text**: The code segment, also known as a text segment or simply as text, is where a portion of an object file or the corresponding section of the program’s virtual address space that contains executable instructions is stored and is generally read-only and fixed size.

- **.data**: The .data segment contains any global or static variables which have a pre-defined value and can be modified. The values for these variables are initially stored within the read-only memory (typically within .text) and are copied into the .data segment during the start-up routine of the program. Example,

  ```
  int val = 3;
  char string[] = "Hello World";
  ```

- **.bss**: Uninitialized data is usually adjacent to the data segment. The BSS segment contains all global variables and static variables that are initialized to zero or do not have explicit initialization in the source code. For instance, a variable defined as `static int i;` would be contained in the BSS segment.

The rough calculation could be done as:

- PROGRAM (Flash) = .text + .data
- DATA (RAM) = .bss + .data

If you need to print all memory sections and addresses, please use `pio run --verbose` command.

Recommended for reading:

- text, data and bss: Code and Data Size Explained

1.23.5 Advanced Serial Monitor with UI

PlatformIO Core provides CLI version (`pio device monitor`) of Serial Monitor. If you need advanced instrument with a rich UI, we recommend free and multi-platform CoolTerm serial port terminal application.
**Warning:** Please note that you need to manually disconnect (close serial port connection) in CoolTerm before doing uploading in PlatformIO. PlatformIO can not disconnect/connect to a target device automatically when CoolTerm is used.

### 1.23.6 Troubleshooting

#### Installation

**Multiple PlatformIO Cores in a system**

Multiple standalone PlatformIO Core (CLI) in a system could lead to the different issues. We highly recommend to keep one instance of PlatformIO Core or use built-in PlatformIO Core in PlatformIO IDE:

- **PlatformIO IDE for Atom** - Menu PlatformIO: Settings > PlatformIO IDE > Use built-in PlatformIO Core
- **VSCode - Settings** > Set `platformio-ide.useBuiltinPIOCore` to `true`.

Finally, if you have a standalone PlatformIO Core (CLI) in a system, please open system Terminal (not PlatformIO IDE Terminal) and uninstall obsolete PlatformIO Core:

```
pip uninstall platformio
```

If you used macOS "brew"

```
brew uninstall platformio
```

If you need to have PlatformIO Core (CLI) globally in a system, please Install Shell Commands.

#### 'platformio' is not recognized as an internal or external command

If you use PlatformIO IDE, please check in PlatformIO IDE Settings that “Use built-in PlatformIO Core” is enabled.

If you modify system environment variable `PATH` in your Bash/Fish/ZSH profile, please do not override global `PATH`. This line `export PATH="/my/custom/path"` is incorrect. Use `export PATH="/my/custom/path":$PATH` instead.

#### 99-platformio-udev.rules

**Note:** Please check that your board’s PID and VID are listed in the rules. You can list connected devices and their PID/VID using `pio device list` command.

This file must be placed at `/etc/udev/rules.d/99-platformio-udev.rules` (preferred location) or `/lib/udev/rules.d/99-platformio-udev.rules` (required on some broken systems).

Please open system Terminal and type
# Recommended

```bash
```

# OR, manually download and copy this file to destination folder

```bash
```

Restart “udev” management tool:

```bash
sudo service udev restart
# or
sudo udevadm control --reload-rules
sudo udevadm trigger
```

Ubuntu/Debian users may need to add own “username” to the “dialout” group if they are not “root”, doing this issuing:

```bash
sudo usermod -a -G dialout $USER
sudo usermod -a -G plugdev $USER
```

Similarly, Arch users may need to add their user to the “uucp” group

```bash
sudo usermod -a -G uucp $USER
sudo usermod -a -G lock $USER
```

**Note:** You will need to log out and log back in again (or reboot) for the user group changes to take effect.

After this file is installed, physically unplug and reconnect your board.

**ImportError: cannot import name _remove_dead_weakref**

Windows users can experience this issue when multiple Python interpreters are installed in a system and conflict each other. The easy way to fix this problem is uninstalling all Python interpreters using Windows Programs Manager and installing them manually again.

2. Install the latest Python interpreter, see [Install Python Interpreter](https://www.platformio.org/docs/integration/python.html) guide
3. Remove `C:\Users\YourUserName\platformio` and `C:\.platformio` folders if exist (do not forget to replace “YourUserName” with the real user name)
4. Restart *PlatformIO IDE*.

**Package Manager**

**[Error 5] Access is denied**

PlatformIO installs all packages to “`core_dir/packages`” directory. **You MUST HAVE** write access to this folder. Please note that *PlatformIO does not require* “*sudo*/administrative privileges.
Solution 1: Remove folder

A quick solution is to remove “core_dir/packages” folder and repeat installation/building/uploading again.

Solution 2: Antivirus

Some antivirus tools forbid programs to create files in the background. PlatformIO Package Manager does all work in the background: downloads package, unpacks archive in temporary folder and moves final files to “core_dir/packages” folder.

Antivirus tool can block PlatformIO, that is why you see “[Error 5] Access is denied”. Try to disable it for a while or add core_dir directory to exclusion/whitelist.

Solution 3: Run from Terminal

As we mentioned in “Solution 2”, antivirus tools can block background file system operations. Another solution is to run PlatformIO Core (CLI) from a system terminal.

1. Open System Terminal, on Windows cmd.exe (not PlatformIO IDE Terminal)
2. Build a project and upload firmware using PlatformIO Core (CLI) which will download and install all dependent packages:

```
# Change directory to PlatformIO Project where is located "platformio.ini"
$ cd path/to/platformio/project

# Force PlatformIO to install PlatformIO Home dependencies
$ pio home

# Force PlatformIO to install toolchains
$ pio run --target upload
```

If “pio” command is not globally available in your environment and you use PlatformIO IDE, please use built-in PlatformIO Core (CLI) which is located in:

- Windows: `C:\Users\{username}\.platformio\penv\Scripts\platformio` Please replace `{username}` with a real user name
- Unix: `~/.platformio/penv/bin/platformio`

Note: You can add platformio and pio commands to your system environment. See Install Shell Commands.
Solution 4: Manual

If none of the solutions above do work for you, you can download and unpack all packages manually to “core_dir/packages”.

Please visit PlatformIO Package Storage and download a package for your platform. A correct package path is “core_dir/packages/{package_name}/package.json”.

Building

UnicodeWarning: Unicode equal comparison failed

Full warning message is “UnicodeWarning: Unicode equal comparison failed to convert both arguments to Unicode - interpreting them as being unequal”.

KNOWN ISSUE. Please move your project to a folder which full path does not contain non-ASCII chars.

UnicodeDecodeError: Non-ASCII characters found in build environment

KNOWN ISSUE. PlatformIO Core (CLI) currently does not support projects which contain non-ASCII characters (codes) in a full path or depend on the libraries which use non-ASCII characters in their names.

TEMPORARY SOLUTION

1. Use PlatformIO IDE, it will automatically install PlatformIO Core (CLI) in a root of system disk (%DISK%/platformio) and avoid an issue when system User contains non-ASCII characters
2. Do not use non-ASCII characters in project folder name or its parent folders.

Also, if you want to place PlatformIO Core (CLI) in own location, see:

• Set PLATFORMIO_CORE_DIR environment variable with own path
• Configure custom location per project using core_dir option in “platformio.ini” (Project Configuration File).

ARM toolchain: cc1plus: error while loading shared libraries

See related answers for error while loading shared libraries.

Archlinux: libncurses.so.5: cannot open shared object file

Answered in issue #291.

Monitoring a serial port breaks upload

Answered in issue #384.
1.24 Release Notes

1.24.1 PlatformIO Core 5

A professional collaborative platform for embedded development

5.0.4 (2020-12-??)

- Check for debug server’s “ready_pattern” in “stderr”

5.0.4 (2020-12-30)

- Added “Core” suffix when showing PlatformIO Core version using `pio --version` command
- Improved `.ccls` configuration file for Emacs, Vim, and Sublime Text integrations
- Updated analysis tools:
  - Cppcheck v2.3 with improved C++ parser and several new MISRA rules
  - PVS-Studio v7.11 with new diagnostics and updated mass suppression mechanism
- Show a warning message about deprecated support for Python 2 and Python 3.5
- Do not provide “intelliSenseMode” option when generating configuration for VSCode C/C++ extension
- Fixed a “git-sh-setup: file not found” error when installing project dependencies from Git VCS (issue #3740)
- Fixed an issue with package publishing on Windows when Unix permissions are not preserved (issue #3776)

5.0.3 (2020-11-12)

- Added an error selector for Sublime Text build runner (issue #3733)
- Generate a working “projectEnvName” for PlatformIO IDE’s debugger for VSCode
- Force VSCode’s intelliSenseMode to “gcc-x64” when GCC toolchain is used
- Print ignored test suites and environments in the test summary report only in verbose mode (issue #3726)
- Fixed an issue when the package manager tries to install a built-in library from the registry (issue #3662)
- Fixed an issue when `pio package pack` ignores some folders (issue #3730)

5.0.2 (2020-10-30)

- Initialize a new project or update the existing passing working environment name and its options (issue #3686)
- Automatically build PlatformIO Core extra Python dependencies on a host machine if they are missed in the registry (issue #3700)
- Improved “core.call” RPC for PlatformIO Home (issue #3671)
- Fixed a “PermissionError: [WinError 5]” on Windows when an external repository is used with `lib_deps` option (issue #3664)
- Fixed a “KeyError: ‘versions’” when dependency does not exist in the registry (issue #3666)
• Fixed an issue with GCC linker when “native” dev-platform is used in pair with library dependencies (issue #3669)
• Fixed an “AssertionError: ensure_dir_exists” when checking library updates from simultaneous subprocesses (issue #3677)
• Fixed an issue when pio package publish command removes original archive after submitting to the registry (issue #3716)
• Fixed an issue when multiple pio lib install command with the same local library results in duplicates in lib_deps (issue #3715)
• Fixed an issue with a “wrong” timestamp in device monitor output using “time” filter (issue #3712)

5.0.1 (2020-09-10)

• Added support for “owner” requirement when declaring dependencies using library.json
• Fixed an issue when using a custom git/ssh package with platform_packages option (issue #3624)
• Fixed an issue with “ImportError: cannot import name ‘_get_backend’ from ‘cryptography.hazmat.backends’” when using Remote Development on RaspberryPi device (issue #3652)
• Fixed an issue when pio package unpublish command crashes (issue #3660)
• Fixed an issue when the package manager tries to install a built-in library from the registry (issue #3662)
• Fixed an issue with incorrect value for C++ language standard in IDE projects when an in-progress language standard is used (issue #3653)
• Fixed an issue with “Invalid simple block (semantic_version)” from library dependency that refs to an external source (repository, ZIP/Tar archives) (issue #3658)
• Fixed an issue when can not remove update or remove external dev-platform using PlatformIO Home (issue #3663)

5.0.0 (2020-09-03)

Please check Migration guide from 4.x to 5.0.

• Integration with the new PlatformIO Trusted Registry
  – Enterprise-grade package storage with high availability (multi replicas)
  – Secure, fast, and reliable global content delivery network (CDN)
  – Universal support for all packages:
    • Libraries
    • Development platforms
    • Toolchains
  – Built-in fine-grained access control (role-based, teams, organizations)
  – New CLI commands:
    • pio package – manage packages in the registry
    • pio access – manage package access for users, teams, and maintainers
• Integration with the new Account Management System
  – Manage organizations
Manage teams and team memberships

New Package Management System

- Integrated PlatformIO Core with the new PlatformIO Registry
- Support for owner-based dependency declaration (resolves name conflicts) (issue #1824)
- Automatically save dependencies to "platformio.ini" when installing using PlatformIO CLI (issue #2964)
- Follow SemVer complaint version constraints when checking library updates (issue #1281)
- Dropped support for "packageRepositories" section in "platform.json" manifest (please publish packages directly to the registry)

Build System

- Upgraded build engine to the SCons 4.0 - a next-generation software construction tool
  - Configuration files are Python scripts – use the power of a real programming language to solve build problems
  - Built-in reliable and automatic dependency analysis
  - Improved support for parallel builds
  - Ability to share built files in a cache to speed up multiple builds
- New Custom Targets
  - Pre/Post processing based on dependent sources (another target, source file, etc.)
  - Command launcher with own arguments
  - Launch command with custom options declared in "platformio.ini"
  - Python callback as a target (use the power of Python interpreter and PlatformIO Build API)
  - List available project targets (including dev-platform specific and custom targets) with a new pio run --list-targets command (issue #3544)
- Enable “cyclic reference” for GCC linker only for the embedded dev-platforms (issue #3570)
- Automatically enable LDF dependency chain+ mode (evaluates C/C++ Preprocessor conditional syntax) for Arduino library when “library.property” has “depends” field (issue #3607)
- Fixed an issue with improper processing of source files added via multiple Build Middlewares (issue #3531)
- Fixed an issue with the clean target on Windows when project and build directories are located on different logical drives (issue #3542)

Project Management

- Added support for "globstar/**" (recursive) pattern for the different commands and configuration options (pio ci, src_filter, check_patterns, library.json > srcFilter). Python 3.5+ is required
- Added a new -e, --environment option to pio project init command that helps to update a PlatformIO project using the existing environment
- Dump build system data intended for IDE extensions/plugins using a new pio project data command
- Do not generate ".travis.yml” for a new project, let the user have a choice

Unit Testing

- Updated PIO Unit Testing support for Mbed framework and added compatibility with Mbed OS 6
- Fixed an issue when running multiple test environments (issue #3523)
– Fixed an issue when Unit Testing engine fails with a custom project configuration file (issue #3583)

• **Static Code Analysis**
  – Updated analysis tools:
    * Cppcheck v2.1 with a new “soundy” analysis option and improved code parser
    * PVS-Studio v7.09 with a new file list analysis mode and an extended list of analysis diagnostics
  – Added Cppcheck package for ARM-based single-board computers (issue #3559)
  – Fixed an issue with PIO Check when a defect with a multiline error message is not reported in verbose mode (issue #3631)

• **Miscellaneous**
  – Display system-wide information using a new `pio system info` command (issue #3521)
  – Remove unused data using a new `pio system prune` command (issue #3522)
  – Show ignored project environments only in the verbose mode (issue #3641)
  – Do not escape compiler arguments in VSCode template on Windows
  – Drop support for Python 2 and 3.5.

### 1.24.2 PlatformIO Core 4

### 1.25 Migrating from 4.x to 5.0

Guidance on how to upgrade from *PlatformIO Core (CLI)* v4.x to v5.x with emphasis on major changes, what is new, and what has been removed.

**PlatformIO Core 5.0 is fully backward compatible with PlatformIO 4.0 projects.**

Please read *PlatformIO 5.0 Release Notes* before.
1.25.1 Migration Steps

2. We recommend updating your project dependency declarations in `lib_deps` using a new owner-based syntax. See the `Library Manager` section for details.

1.25.2 What is new

In this section, we are going to highlight the most important changes and features introduced in PlatformIO Core (CLI) 5.0. Please visit `PlatformIO 5.0 Release Notes` for more detailed information.

PlatformIO Trusted Registry

PlatformIO Core 5.0 has been switched to the official PlatformIO Trusted Registry:

- Enterprise-grade package storage with high availability (multi replicas)
- Secure, fast, and reliable global content delivery network (CDN)
- Universal support for all packages:
  - Libraries
  - Development platforms
  - Toolchains
- Built-in fine-grained access control (role-based, `teams, organizations`).
The new Web front-end and upgraded PlatformIO Home are coming soon.

Collaborative Platform

PlatformIO Core 5.0 is fully unlocked for developers and teams. They can now share their packages (libraries, Development Platforms, toolchains) with team members or collaborate on open source projects. There are new CLI commands that help you to manage organizations, teams, team memberships, and resource access:

- `pio package` - manage packages in the registry
- `pio org` - manage organizations
- `pio team` - manage teams and team memberships
- `pio access` - manage package access for users, teams, and maintainers.

Package Management

The package management infrastructure has been rewritten from scratch. It is based now on the new PlatformIO Trusted Registry that supports a strict dependency declaration using the package owner. This improvement resolves the issues when package maintainers publish packages under the same name.

PlatformIO Core 5.0 does not handle packages from unofficial repositories declared via `packageRepositories` in `platform.json`. There were a lot of security issues and reports when PlatformIO Core 4.0 hangs when you manage external dependencies.

PlatformIO Core 5.0 uses THE ONLY official PlatformIO Trusted Registry that supports not only the libraries but also Development Platforms and toolchains.

Package maintainers can publish their libraries, development platforms, and toolchains to the registry using `pio package` CLI.

Library Manager

The biggest improvement for Library Management is the owner-based dependency declaration. You can finally forget about conflicts with library names in the registry. Use the new syntax `ownername/pkgname` to declare an owner-based dependency in "platformio.ini" (Project Configuration File) via `lib_deps`:

```
[env:myenv]
platform = ...
framework = ...
board = ...
lib_deps =
  bblanchon/ArduinoJson @ ^6.16.1
  knolleary/PubSubClient @ ^2.8
```

You can find an owner name of a library in the registry using PlatformIO Home > Libraries > Some Library > Installation tab.

Build System

SCons 4.0

PlatformIO Core 5.0 build engine has been upgraded to the latest SCons 4.0 - a next-generation software construction tool:
• *Configuration files are Python scripts* – use the power of a real programming language to solve build problems
• Built-in reliable and automatic dependency analysis
• Improved support for parallel builds
• Ability to *share built files in a cache* to speed up multiple builds.

**Custom Targets**

PlatformIO Core 5.0 gives more freedom to developers and *Development Platforms* maintainers. They can now declare the *Custom Targets:*

• Pre/Post processing based on dependent sources (another target, source file, etc.)
• Command launcher with own arguments
• Launch command with custom options declared in “platformio.ini” (*Project Configuration File*)
• Python callback as a target (use the power of Python interpreter and PlatformIO Build API)
• List available project targets (including dev-platform specific and custom targets) with a new `pio run --list-targets` command

See *Build System* section in *PlatformIO Core 5* release notes for more details.

### 1.25.3 What is changed or removed

**Drop support for Python 2 and 3.5**

Python 2.7 is reached the *end of its life* on 1 January 2020, and Python Software Foundation will not provide any security fixes for it. The same situation with Python 3.5.

To avoid unrelated issues to the PlatformIO Core, we decided to drop support for Python 2 and 3.5. *The minimum supported version for PlatformIO Core 5.0 is Python 3.6.*

If you use *PlatformIO IDE,* it already comes with the built-in compatible Python 3 interpreter. You do not need to do any extra steps. If you see a warning message that your local PlatformIO Core installation uses incompatible Python, please do the next steps:

1. Install the latest Python 3 following this guide *Install Python Interpreter*
2. Open system terminal and type `python3 --version` or `python.exe --version` (for Windows). The output should contain a version of Python 3.6 or above (depending on which you installed it).
3. Remove PlatformIO Core installation “penv” folder that is located by this path `USER_HOME_DIR/.platformio/penv`. If you use Windows and your user name contains non-ASCII chars the “penv” folder is located in `C:/platformio/penv`
4. Install PlatformIO Core using *Installer Script*
5. Run the `pio system info` command and ensure that Python 3 is used.

**Introducing Strict SSL/TLS**

The setting `strict_ssl` has been removed from *pio settings*. Now, PlatformIO Core 5.0 communicates over the encrypted SSL/TLS by default with the PlatformIO Registry and other services such as *Remote Development.*

At PlatformIO, we are always looking for ways to improve the security of our services.
**packageRepositories**

PlatformIO Core 5.0 does not support unofficial package repositories declared through `packageRepositories` in `platform.json` that was introduced in PlatformIO 3.0.

Please publish your development platforms and toolchains to the PlatformIO Trusted Registry using `pio package` CLI.

**Command Line Interface**

The following commands have been changed in v5.0.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pio access</code></td>
<td>New. Manage package access for users, teams, and maintainers</td>
</tr>
<tr>
<td><code>pio package</code></td>
<td>New. Manage packages in the registry (publish, unpublish)</td>
</tr>
<tr>
<td><code>pio project data</code></td>
<td>New. Dump build system data intended for IDE extensions/plugins</td>
</tr>
<tr>
<td><code>pio system info</code></td>
<td>New. Display system-wide information</td>
</tr>
<tr>
<td><code>pio system prune</code></td>
<td>New. Remove unused data</td>
</tr>
<tr>
<td><code>pio project init</code></td>
<td>Update project configuration for the specific environment using <code>pio project init --environment</code> option</td>
</tr>
<tr>
<td><code>pio run</code></td>
<td>List projects targets with <code>pio run --list-targets</code> option</td>
</tr>
<tr>
<td><code>pio account destroy</code></td>
<td>New command to remove permanently PlatformIO Account and related data</td>
</tr>
</tbody>
</table>
