A place where Developers and Teams have true Freedom! No more vendor lock-in!

- Open source, maximum permissive Apache 2.0 license
- Cross-platform IDE and Unified Debugger
- Static Code Analyzer and Remote Unit Testing
- Multi-platform and Multi-architecture Build System
- Firmware File Explorer and Memory Inspection.

Social: LinkedIn | Twitter | Facebook | Community Forums
1.1 What is PlatformIO?

A place where Developers and Teams have true Freedom! No more vendor lock-in!

PlatformIO is a cross-platform, cross-architecture, multiple framework, professional tool for embedded systems engineers and for software developers who write applications for embedded products.

1.1.1 Awards

PlatformIO was nominated for the year’s best Software and Tools in the 2015/16 IoT Awards. A native PlatformIO IDE extension for Microsoft VSCode editor is the most rated/reviewed extension with over 800 five-star reviews in the whole Microsoft Marketplace. It also was installed by over 750,000 unique developers around the world.

1.1.2 Philosophy

PlatformIO’s unique philosophy in the embedded market provides developers with a modern integrated development environment (Cloud & Desktop IDE) that works cross-platform, supports many different software development kits...
(SDKs) or Frameworks, and includes sophisticated debugging (Debugging), unit testing (Unit Testing), automated code analysis (Static Code Analysis), and remote management (Remote Development). It is architected to maximize flexibility and choice by developers, who can use either graphical or command line editors (PlatformIO Core (CLI)), or both.

PlatformIO is a must-have tool for professional embedded systems engineers who develop solutions on more than one specific platform. In addition, by having a decentralized architecture, PlatformIO offers both new and existing developers a quick integration path for developing commercial-ready products, and reduces the overall time-to-market. And it runs on any one of your favorite modern operating systems (macOS, MS Windows, Linux, FreeBSD).

1.1.3 Technologies

PlatformIO applies the latest scalable and flexible software technology to the embedded market – an area traditionally served by complex software tools that experienced hardware engineers have learned over time (often painfully so). Instead, with PlatformIO, users can be hobbyists or professionals. They can import the classic Arduino “Blink” sketch or develop a sophisticated low-level embedded C program for a commercial product. Example code for any supported framework can be compiled and uploaded to a target platform in minutes.

The build system structure automatically tags software dependencies and applies them using a modular hierarchy that takes away the usual complexity and pain. Developers no longer have to manually find and assemble an environment of toolchains, compilers, and library dependencies to develop applications for a specific target. With PlatformIO, clicking the compile button will bring in all necessary dependencies automatically. It’s analogous to if you were a furniture designer, and your CAD program had a “build” button that caused a robot to fetch all the necessary pieces and fasteners and correctly assemble them.

PlatformIO Core (CLI) is a unique, developed-from-scratch build system that removes the usual pain of software integration, packaging, and library dependencies that developers encounter when they move beyond the bounds of a specific SDK or example embedded application. It can be used with a variety of code development environments and allows easy integration with numerous cloud platforms and web services feeds. The user experiences no barriers to getting started quickly: no license fees, no legal contracts. The user maintains full flexibility of the build environment because the tools are open source and permissively licensed (no permission needed to modify them, and no requirement to share changes.)

1.1.4 Problematic

- The main problem which repulses people from the embedded world is a complicated process to setup development software for a specific MCU/board: toolchains, proprietary vendor’s IDE (which sometimes isn’t free) and what is more, to get a computer with OS where that software is supported.
- Multiple hardware platforms (MCUs, boards) require different toolchains, IDEs, etc, and, respectively, spending time on learning new development environments.
- Finding proper libraries and code samples showing how to use popular sensors, actuators, etc.
- Sharing embedded projects between team members, regardless of an operating system they prefer to work with.

1.1.5 How does it work?

Without going too deep into PlatformIO implementation details, work cycle of the project developed using PlatformIO is as follows:

- Users choose board(s) interested in “platformio.ini” (Project Configuration File)
- Based on this list of boards, PlatformIO downloads required toolchains and installs them automatically.
• Users develop code and PlatformIO makes sure that it is compiled, prepared and uploaded to all the boards of interest.

1.2 PlatformIO IDE

PlatformIO IDE is the next-generation integrated development environment for IoT.

• Cross-platform build system without external dependencies to the OS software:
  – 800+ Boards
  – 35+ Development Platforms
  – 20+ Frameworks
• Debugging
• Remote Development
• Unit Testing
• C/C++ Intelligent Code Completion
• C/C++ Smart Code Linter for rapid professional development
• Library Manager for the hundreds popular libraries
• Multi-projects workflow with multiple panes
• Themes support with dark and light colors
• Serial Port Monitor
• Built-in Terminal with PlatformIO Core (CLI) and CLI tool (pio, platformio)
• Built-in PlatformIO Home.

We provide official packages (plugins, extensions) for the most popular IDEs and text editors.

Note: In our experience, VSCode offers better system performance, and users have found it easier to get started

1.2.1 PlatformIO for VSCode

Visual Studio Code is a lightweight but powerful source code editor which runs on your desktop and is available for Windows, macOS and Linux. It comes with built-in support for JavaScript, TypeScript and Node.js and has a rich ecosystem of extensions for other languages (such as C++, C#, Python, PHP, Go) and runtimes (such as .NET and Unity).

Install PlatformIO for VSCode / Get started
1.2.2 PlatformIO for CLion

The **CLion** is a cross-platform C/C++ IDE for Linux, OS X, and Windows. CLion includes such features as a smart editor, code generation, code quality assurance, automated refactorings, on-the-fly code analysis, project manager, integrated version control systems and debugger.

*Install PlatformIO for CLion / Get started*
1.3 PlatformIO Core (CLI)

PlatformIO Core (CLI tool) is a heart of whole PlatformIO ecosystem and consists of

- Multi-platform Build System
- Development platform and package managers
- Library Management
- Library Dependency Finder (LDF)
- Serial Port Monitor
- Integration components (Cloud & Desktop IDE and Continuous Integration).

PlatformIO Core is written in Python and works on Windows, macOS, Linux, FreeBSD and ARM-based credit-card sized computers (Raspberry Pi, BeagleBone, CubieBoard, Samsung ARTIK, etc.).

PlatformIO Core provides a rich and documented Command Line Interface (CLI). The other PlatformIO-based software and IDEs are based on PlatformIO Core CLI, such as PlatformIO IDE. In other words, they wrap PlatformIO Core with own GUI.

Note: Please note that you do not need to install PlatformIO Core if you are going to use PlatformIO IDE. PlatformIO Core is built into PlatformIO IDE and you will be able to use it within PlatformIO IDE Terminal.

If you need PlatformIO Core commands outside PlatformIO IDE, please Install Shell Commands.

### 1.3.1 Demo

**Contents**

- **“Blink Project”**
  - Used in demo
- **Platform Manager**
  - Used in demo
- **Library Manager**
  - Used in demo
- **Over-the-Air update for ESP8266**
  - Used in demo

**“Blink Project”**

**Used in demo**

1. Source code of Wiring Blink Example
2. `pio run` command
3. `pio run -t upload` command.

**Platform Manager**
Used in demo

1. *Platform Manager CLI*
2. `$pio platform list` command
3. `$pio platform search avr` command
4. `$pio platform show teensy` command
5. `$pio platform update` command.

Library Manager

Used in demo

1. *Library Manager CLI*
2. `$pio lib search 1-wire` command
3. `$pio lib install 54` command
4. `$pio lib search -f mbed` command
5. `$pio lib search -k rf` command
6. `$pio lib search radiohead` command
7. `$pio lib install 124 –version “1.40”` command
8. `$pio lib show 124` command
9. `$pio lib update` command.
Over-the-Air update for ESP8266

1. `pio run` command
2. `pio run -t upload` command.

### 1.3.2 Installation

**Note:** Please note that you do not need to install *PlatformIO Core (CLI)* if you are going to use *PlatformIO IDE*. *PlatformIO Core (CLI)* is built into PlatformIO IDE and you will be able to use it within PlatformIO IDE Terminal.

If you need *PlatformIO Core (CLI)* outside PlatformIO IDE, please *Install Shell Commands*.

*PlatformIO Core* is written in *Python* and works on *Windows*, *macOS*, *Linux*, *FreeBSD* and *ARM*-based credit-card sized computers (*Raspberry Pi*, *BeagleBone*, *CubieBoard*, *Samsung ARTIK*, etc.).

- **System requirements**
- **Installation Methods**
  - Installer Script
    - Super-Quick (*Mac / Linux*)
    - Local Download (*Mac / Linux / Windows*)
  - Python Package Manager
System requirements

**Operating System**  Windows, macOS, Linux, FreeBSD, Linux ARMv6+

**Python Interpreter**  Python 3.6+ or above. See detailed instruction on how to *Install Python Interpreter*.

**Terminal Application**  All commands below should be executed in Command-line application (Terminal). For macOS and Linux OS - *Terminal* application, for Windows OS – *cmd.exe* application.

**Access to Serial Ports (USB/UART)**  *Windows Users:*  Please check that you have correctly installed USB driver from board manufacturer

*Linux Users:*

- Please install *99-platformio-udev.rules*
- Raspberry Pi users, please read this article [Enable serial port on Raspberry Pi](#).

Installation Methods

Please *choose ONE of* the following methods:

- **Installer Script**
  - *Super-Quick (Mac / Linux)*
  - *Local Download (Mac / Linux / Windows)*

- **Python Package Manager**
macOS Homebrew

Installer Script

**Warning:** PlatformIO **DOES NOT** require administrative/sudo permissions. Please install using default user account **WITHOUT EXTRA PERMISSIONS.**

**Super-Quick (Mac / Linux)**

To install or upgrade **PlatformIO Core** paste that at a *Terminal* prompt:

```bash
python3 -c "$(curl -fsSL https://raw.githubusercontent.com/platformio/platformio/master/scripts/get-platformio.py)"
```

# or using `curl`

```
python3 get-platformio.py
```

# or using `wget`

```
python3 get-platformio.py
```

**Local Download (Mac / Linux / Windows)**

To install or upgrade **PlatformIO Core**, download (save as...) *get-platformio.py* script. Then run the following:

```bash
# change directory to folder where is located downloaded "get-platformio.py"
cd /path/to/dir/where/is/located/get-platformio.py/script

# run it
python get-platformio.py
```

On **Windows OS** it may look like:

```bash
# change directory to folder where is located downloaded "get-platformio.py"
cd C:/path/to/dir/where/is/located/script/get-platformio.py

# run it
python.exe get-platformio.py
```

**Note:** If you need to have access to **platformio** or **platformio.exe** commands from other applications or terminal in your OS, please *Install Shell Commands.*
Python Package Manager

**Warning:** We recommend using this method ONLY FOR Continuous Integration use cases or where you have full permissions to install PlatformIO Core into the global scope of your OS.

For personal using, and avoiding maintenance and upgrade issues, we HIGHLY RECOMMEND using Installer Script which installs PlatformIO Core into an isolated virtual environment and does not affect your OS.

The latest stable version of PlatformIO Core may be installed or upgraded via Python Package Manager (pip) as follows:

```
pip install -U platformio
```

macOS Homebrew

The latest stable version of PlatformIO may be installed or upgraded via macOS Homebrew Packages Manager (brew) as follows:

```
brew install platformio
```

Development Version

**Warning:** If you use PlatformIO IDE, please enable development version:

- **PlatformIO IDE for Atom:** “Menu PlatformIO: Settings > PlatformIO IDE > Use development version of PlatformIO Core”
- **VSCode:** Set `platformio-ide.useDevelopmentPIOCore` to true in Settings.

Install the latest PlatformIO from the develop branch:

```
# uninstall existing version
pip uninstall platformio

# install the latest development version of PlatformIO
pip install -U https://github.com/platformio/platformio-core/archive/develop.zip
```

If you want to be up-to-date with the latest develop version of PlatformIO, then you need to re-install PlatformIO each time you see a new commits in PlatformIO GitHub repository (branch: develop) like so:

```
pip install -U https://github.com/platformio/platformio-core/archive/develop.zip
```

Or:

```
PIO upgrade --dev
```

To revert to the latest stable version:

```
pip uninstall platformio
pip install -U platformio
```
Install Shell Commands

PlatformIO Core (CLI) consists of 2 standalone tools in a system:

- `platformio` or `pio` (short alias) - CLI Guide
- `piodebuggdb` - alias of `pio debug`

If you have PlatformIO IDE already installed, you do not need to install PlatformIO Core (CLI) separately. Just link these tools with your shell:

- **Unix and Unix-like**
  - **Method 1**
  - **Method 2**
- **Windows**

### Unix and Unix-like

In Unix and Unix-like systems, there are multiple ways to achieve this.

#### Method 1

You can export PlatformIO executables’ directory to the PATH environmental variable. This method will allow you to execute `platformio` commands from any terminal emulator as long as you’re logged in as the user PlatformIO is installed and configured for.

If you use Bash as your default shell, you can do it by editing either `~/.profile` or `~/.bash_profile` and adding the following line:

```
export PATH=$PATH:~/.platformio/penv/bin
```

If you use Zsh, you can either edit `~/.zprofile` and add the code above, or for supporting both, Bash and Zsh, you can first edit `~/.profile` and add the code above, then edit `~/.zprofile` and add the following line:

```
emulate sh -c '. ~/.profile'
```

After everything’s done, just restart your session (log out and log back in) and you’re good to go.

If you don’t know the difference between the two, check out this page.

#### Method 2

You can create system-wide symlinks. This method is not recommended if you have multiple users on your computer because the symlinks will be broken for other users and they will get errors while executing PlatformIO commands. If that’s not a problem, open your system terminal app and paste these commands (MAY require administrator access `sudo`):

```
ln -s ~/.platformio/penv/bin/platformio /usr/local/bin/platformio
ln -s ~/.platformio/penv/bin/pio /usr/local/bin/pio
ln -s ~/.platformio/penv/bin/piodebuggdb /usr/local/bin/piodebuggdb
```
After that, you should be able to run PlatformIO from terminal. No restart is required.

**Windows**

Please read one of these instructions [How do I set or change the PATH system variable?](#).

You need to edit system environment variable called `Path` and append

```bash
C:\Users\UserName\.platformio\penv\Scripts; path in the beginning of a list (please replace `UserName` with your account name).
```

**Uninstall PlatformIO Core and dependent packages**

- Uninstall PlatformIO Core tool

```bash
# uninstall standalone PlatformIO Core installed via `pip`
pip uninstall platformio

# uninstall Homebrew's PlatformIO Core (only macOS users if you installed it via Homebrew before)
brew uninstall platformio
```

- Dependent packages, global libraries are installed to `core_dir` folder (in user’s HOME directory). Just remove it.

**Integration with custom applications (extensions, plugins)**

We recommend using PlatformIO Core Installer Script when you integrate PlatformIO Core into an application, such as extension or plugin for IDE. Examples that use this installer are:

- `platformio-node-helpers`, is used by PlatformIO IDE for VSCode and PlatformIO IDE for Atom

**Prerequisite**

**Python Interpreter**

PlatformIO Core Installer Script is written in Python and is compatible with Python 2.7+ and Python 3.5+. We highly recommend using the latest Python 3.

Python is installed by default on the most popular Unix OS (macOS, Linux, FreeBSD). If there is no Python on a user machine (you can check running `python --version`), we have 2 options:

1. Ask the user to install Python 3 using our guide [Install Python Interpreter](#).
2. You can automatically Download Portable Python 3 and unpack it in a cache folder of your application. Later, you can use `unpacked_portable_python_dir/python.exe` for the installer script.

**Installer Script**

There are 2 options on how to work with PlatformIO Core Installer Script:

1. Bundle `get-platformio.py` file into your application
2. Download `get-platformio.py` file on demand.
In both cases, you will need to have `get-platformio.py` script on the end-user machine. You can copy or download it to a cache/temporary folder.

A list of arguments and options for the installer script is available via

```
python get-platformio.py --help
```

**Workflow**

We will describe a simple workflow on how to automatically install PlatformIO Core (CLI) for end-user of your application/extension. We assume that `get-platformio.py` script is already copied/downloaded and exists on the end-user machine. See above how to get it.

**Step 1. Where is PlatformIO Core installed?**

You should check the PlatformIO Core installation state **each time** when the user starts your application. You need to call the Installer Script with `check core` arguments:

```
python get-platformio.py check core
```

This command returns 0 “exit code” when PlatformIO Core is already installed and is ready for use, otherwise, the non-zero code of subprocess will be returned and you need to install PlatformIO Core (see **Step #2** below).

If you need to have full information about PlatformIO Core installation state, please run with `--dump-state` option and specify a folder or a full path where to save data in JSON format:

```
get-platformio.py check core --dump-state tmpdir/pioinstaller-state.json
```

Now, read JSON file and use `platformio_exe` binary to call PlatformIO Core using CLI (see CLI Guide). You can also export `penv_bin_dir` into system environment PATH variable and `platformio` command will be available without a full path.

Example of `pioinstaller-state.json` run on macOS:

```
{
    "cache_dir": "/Users/Freedom/.platformio/.cache",
    "core_dir": "/Users/Freedom/.platformio",
    "core_version": "4.3.1",
    "installer_version": "0.2.0",
    "is_develop_core": false,
    "penv_bin_dir": "/Users/Freedom/.platformio/penv/bin",
    "penv_dir": "/Users/Freedom/.platformio/penv",
    "platformio_exe": "/Users/Freedom/.platformio/penv/bin/platformio",
    "python_exe": "/Users/Freedom/.platformio/penv/bin/python",
    "system": "darwin_x86_64"
}
```

**Step 2. Install PlatformIO Core**

To install PlatformIO Core into the virtual environment in an automatic mode, please call installer script without any arguments:

```
python get-platformio.py
```
Available options:

- `--verbose`, verbose output
- `--dev`, install the latest development version of PlatformIO Core
- `--ignore-python`, a path to Python to be ignored (multiple options and unix wildcards are allowed)

More options are available at `python get-platformio.py --help`

Installer Script will return exit code 0 on success, otherwise non-zero code and error explanation.

Next time just use again `python get-platformio.py check core` as described in Step #1 (see above).

**Troubleshooting**

**Note:** Linux OS: Don’t forget to install “udev” rules file `99-platformio-udev.rules` (an instruction is located in the file).

**Windows OS:** Please check that you have correctly installed USB driver from board manufacturer

For further details, frequently questions, known issues, please refer to *Frequently Asked Questions*.

If you find any issues with PlatformIO Core Installer Script, please report to https://github.com/platformio/platformio-core-installer/issues

### 1.3.3 Quick Start

This tutorial introduces you to the basics of **PlatformIO Core (CLI)** Command Line Interface (CLI) workflow and shows you a creation process of a simple cross-platform “Blink” Project. After finishing you will have a general understanding of how to work with the multiple development platforms and embedded boards.

**Setting Up the Project**

*PlatformIO Core (CLI)* provides special `pio project init` command for configuring your projects. It allows one to initialize new empty project or update existing with the new data.

What is more, `pio project init` can be used for **Cloud & Desktop IDE**. It means that you will be able to import pre-generated PlatformIO project using favorite IDE and extend it with the professional instruments for IoT development.

This tutorial is based on the next popular embedded boards and development platforms using *Arduino*:

<table>
<thead>
<tr>
<th>Platform</th>
<th>Board</th>
<th>Framework</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atmel AVR</td>
<td>Arduino Uno</td>
<td>Arduino</td>
</tr>
<tr>
<td>ESPressif 8266</td>
<td>NodeMCU 1.0 (ESP-12E Module)</td>
<td>Arduino</td>
</tr>
<tr>
<td>Teensy</td>
<td>Teensy 3.1 / 3.2</td>
<td>Arduino</td>
</tr>
</tbody>
</table>

**Board Identifier**

`pio project init` command requires to specify board identifier ID. It can be found using *Boards* catalog, *Boards Explorer* or `pio boards` command. For example, using `pio boards` let’s try to find Teensy boards:
According to the table above the ID for Teensy 3.1 / 3.2 is teensy31. Also, the ID for Arduino Uno is uno and for NodeMCU 1.0 (ESP-12E Module) is nodemcuv2.

Initialize Project

PlatformIO ecosystem contains big database with pre-configured settings for the most popular embedded boards. It helps you to forget about installing toolchains, writing build scripts or configuring uploading process. Just tell PlatformIO the Board ID and you will receive full working project with pre-installed instruments for the professional development.

1. Create empty folder where you are going to initialize new PlatformIO project. Then open system Terminal and change directory to it:

```
# create new directory
> mkdir path_to_the_new_directory

# go to it
> cd path_to_the_new_directory
```

2. Initialize project for the boards mentioned above (you can specify more than one board at time):

```
> pio project init --board uno --board nodemcuv2 --board teensy31
```

The current working directory *** will be used for the new project. You can specify another project directory via `pio project init -d %PATH_TO_THE_PROJECT_DIR%` command.

The next files/directories will be created in *** platformio.ini - Project Configuration File. |-> PLEASE EDIT ME <-| src - Put your source files here lib - Put here project specific (private) libraries Do you want to continue? [y/N]: y Project has been successfully initialized! Useful commands:

```
> pio run - process/build project from the current directory
> pio run --target upload or [pio run -t upload] - upload firmware to embedded board
> pio run --target clean - clean project (remove compiled files)
```

Congrats! You have just created the first PlatformIO based Project with the next structure:

- "platformio.ini" (Project Configuration File)
- src directory where you should place source code (*.h, *.c, *.cpp, *.S, *.ino, etc.)
• `lib` directory can be used for the project specific (private) libraries. More details are located in `lib/README` file.

• Miscellaneous files for VCS and Continuous Integration support.

Note: If you need to add new board to the existing project please use `pio project init` again.

The result of just generated `platformio.ini`:

```
; PlatformIO Project Configuration File
;
; Build options: build flags, source filter, extra scripting
; Upload options: custom port, speed and extra flags
; Library options: dependencies, extra library storages
;
; Please visit documentation for the other options and examples
; https://docs.platformio.org/page/projectconf.html

[env:uno]
platform = atmelavr
framework = arduino
board = uno

[env:nodemcuv2]
platform = espressif8266
framework = arduino
board = nodemcuv2

[env:teensy31]
platform = teensy
framework = arduino
board = teensy31
```

Now, we need to create `main.cpp` file and place it to `src` folder of our newly created project. The contents of `src/main.cpp`:

```
/**
 * Blink
 *
 * Turns on an LED on for one second,
 * then off for one second, repeatedly.
 */
#include "Arduino.h"

#ifndef LED_BUILTIN
#define LED_BUILTIN 13
#endif

void setup()
{
    // initialize LED digital pin as an output.
    pinMode(LED_BUILTIN, OUTPUT);
}

void loop()
{
    // turn the LED on (HIGH is the voltage level) (continues on next page)
```
The final Project structure:

```
project_dir
  lib
    README
    platformio.ini
  src
    main.cpp
```

### Process Project

*PlatformIO Core (CLI)* provides special *pio run* command to process project. If you call it without any arguments, PlatformIO Build System will process all project environments (which were created per each board specified above). Here are a few useful commands:

- `pio run`. Process (build) all environments specified in “platformio.ini” (Project Configuration File)
- `pio run --target upload`. Build project and upload firmware to the all devices specified in “platformio.ini” (Project Configuration File)
- `pio run --target clean`. Clean project (delete compiled objects)
- `pio run -e uno`. Process only uno environment
- `pio run -e uno -t upload`. Build project only for uno and upload firmware.

Please follow to *pio run --list-targets* documentation for the other targets.

Finally, demo which demonstrates building project and uploading firmware to Arduino Uno:

**Further Reading**

- Project examples
- *CLI Guide* for *PlatformIO Core (CLI)* commands

### 1.3.4 CLI Guide

**Contents**
Usage

pio [OPTIONS] COMMAND
# alias of "pio"
platformio [OPTIONS] COMMAND

Options

--no-ansi
Do not print ANSI control characters.

See also PLATFORMIO_NO_ANSI and PLATFORMIO_FORCE_ANSI environment variables.

--version
Show the version of PlatformIO

--help, -h
Show help for the available options and commands

$ pio --help
$ pio COMMAND --help

Commands

pio access

New in version 5.0.
Set access level on published resources (packages) in the registry.

You must have privileges to set the access of a resource:

- You are an owner of published resources
- You are a member of the team that owns a resource
- You have been given “maintainer” privileges for a package, either as a member of a team or directly as an owner.

Management of teams and team memberships is done with the pio team command.
To print all available commands and options use:

pio access --help
pio access COMMAND --help
pio access grant

New in version 5.0.

Usage

```
pio access grant [OPTIONS] LEVEL <ORGNAME:TEAMNAME>|<USERNAME> URN
```

Description

Add the ability of users and teams to have “LEVEL” access to a resource.

The next levels are supported:

- **admin** Administrative privileges. Can perform all available operations on the particular resource.
- **maintainer** Read-write access. Can update a resource, publish a new version, unpublish existing version.
- **guest** Read-only access. It’s automatically granted for the public resources.

You can grant access to the team members using the next format `<orgname:teamname>`. See the examples below.

Options

- **--urn-type**

  Resource type in URN form. Default is set to `prn:reg:pkg` which means to grant an access to the package in the PlatormIO Registry.

Examples

1. Grant “maintainer” access to a resource for the “bob” user:

   ```
   > pio access grant maintainer bob prn:reg:pkg:8036:platform
   Access for resource "prn:reg:pkg:8036:platform" has been granted for "bob"
   ```

2. Add the ability of PlatformIO’s “developer” team to have “admin” access to a resource.
Access for resource "prn:reg:pkg:8036:platform" has been granted for "platformio:developers"

```

Description

Show all of the resources (packages) a user or a team can access, along with the access level, except for read-only public resources (it won’t print the whole registry listing).

To list resources by the specified owner, type owner’s “username” as an argument to this command.

See the examples below.

Options

--urn-type

Resource type in URN form. Default is set to prn:reg:pkg which means to list the packages from the registry.

--json-output

Return the output in JSON format
Examples

1. List all accessible resources:

```plaintext
> pio access list
...
atmelsam
--------
URN: prn:reg:pkg:8007:platform
Owner: platformio
Access level(s): Admin
espressif8266
-------------
URN: prn:reg:pkg:8008:platform
Owner: platformio
Access level(s): Admin
chipsalliance
----------
URN: prn:reg:pkg:8036:platform
Owner: platformio
Access level(s): Admin
contrib-piohome
---------------
Owner: platformio
Access level(s): Admin
contrib-pysite
------------
URN: prn:reg:pkg:8038:tool
Owner: platformio
Access level(s): Admin
...
```

2. List all accessible resources by specific owner:

```plaintext
> pio access list platformio
...
tool-scons
--------
URN: prn:reg:pkg:8192:tool
Owner: platformio
Access level(s): Admin
tool-simavr
---------
URN: prn:reg:pkg:8193:tool
Owner: platformio
Access level(s): Admin
```

(continues on next page)
pio access private

New in version 5.0.

Usage

```bash
pio access private [OPTIONS] URN
```

Description

Set a resource to be either privately accessible (restricted access to particular users or team members).

Options

`--urn-type`

Resource type in URN form. Default is set to `prn:reg:pkg` which means to grant access to the package in the registry.

Examples

```bash
> pio access private prn:reg:pkg:8036:platform
The resource "prn:reg:pkg:8036:platform" has been successfully updated.
```

See Also

- `pio access public`

1.3. PlatformIO Core (CLI)
pio access public

New in version 5.0.

Contents

• pio access public
  – Usage
  – Description
  • Options
  – Examples
  – See Also

Usage

pio access public [OPTIONS] URN

Description

Set a resource to be either publicly accessible.

Options

--urn-type

Resource type in URN form. Default is set to prn:reg:pkg which means to grant access to the package in the registry.

Examples

> pio access public prn:reg:pkg:8036:platform
The resource "prn:reg:pkg:8036:platform" has been successfully updated.

See Also

• pio access private

pio access revoke

New in version 5.0.
Usage

```bash
pio access revoke [OPTIONS] <ORGNAME:TEAMNAME>|<USERNAME> URN
```

Description

Remove the ability of users and teams to have access to a resource.
You can revoke access for the team members using the next format `orgname:teamname`.
See the examples below.

Options

```
--urn-type
```
Resource type in URN form. Default is set to `prn:reg:pkg` which means to grant an access to the package in the registry.

Examples

1. Revoke access from a resource for the “bob” user:

```bash
> pio access revoke bob prn:reg:pkg:8036:platform
Access for resource "prn:reg:pkg:8036:platform" has been revoked for "bob"
```

2. Add the ability of PlatformIO’s “developer” team to have “admin” access to a resource.

```bash
> pio access revoke platformio:developers prn:reg:pkg:8036:platform
Access for resource "prn:reg:pkg:8036:platform" has been revoked for
→"platformio:developers"
```

pio account

cli helper command for platformio account.
to print all available commands and options use:

```
pio account --help
pio account COMMAND --help
```

pio account destroy

contents

• pio account destroy
  – usage
  – description

usage

```
pio account destroy [OPTIONS]
```

description

permanently remove account and related data (organizations, teams, resources).

WARNING! it can not be restored.

pio account forgot

contents

• pio account forgot
  – usage
  – description
    * options

usage

```
pio account forgot [OPTIONS]
```
Description

Allows you to reset password for PlatformIO Account using username or email which were specified for registration.

Options

--username, -u

Username or email. You can omit this option and enter username or email in Forgot Wizard later.

pio account login

Usage

pio account login [OPTIONS]

Description

Log in to PlatformIO Account. If you are not able to provide authentication credentials manually you can use PLATFORMIO_AUTH_TOKEN. This is very useful for Continuous Integration systems and Remote Development operations.

Options

--username, -u

Username or email. You can omit this option and enter username or email in Login Wizard later.

--password, -p

You can omit this option and enter securely password in Login Wizard later.

pio account logout

Contents

• pio account logout
Usage

pio account logout

Description

Log out of PlatformIO Account.

pio account password

Contents

• pio account password
  – Usage
  – Description

Usage

pio account password

Description

Change password for PlatformIO Account.

pio account register

Contents

• pio account register
  – Usage
  – Description
  • Options
Usage

```bash
pio account register [OPTIONS]
```

Description

Create a new PlatformIO Account.

Options

You can omit these options and enter them later in Register Wizard.

```bash
--username, -u
```
A username. You can use it later for `pio account login`, `pio account update`, and `pio account forgot` commands.
The username must contain at least 4 characters including single hyphens, and cannot begin or end with a hyphen.

```bash
--email, -e
```
An email. Please enter existing email, you will receive a confirmation letter.

```bash
--password, -p
```
A password. You will need it for `pio account login`, `pio account password`, `pio account token`, and `pio account update` commands.

```bash
--firstname
```
A first name.

```bash
--lastname
```
A last name.

**pio account show**
**Description**

Show detailed information about *PlatformIO Account*:

- Active subscriptions
- Available packages and services

**Options**

`--json-output`

Return the output in JSON format

**pio account token**

**Usage**

`pio account token`

**Description**

Get or regenerate Personal Authentication Token. It is very useful for *Continuous Integration* systems, *Remote Development* operations where you are not able to authorize manually.

PlatformIO handles Personal Authentication Token from environment variable `PLATFORMIO_AUTH_TOKEN`.

**Options**

`--regenerate`

If this option is specified a new authentication token will be generated.

`--json-output`

Return the output in JSON format
pio account update

Usage
pio account update [OPTIONS]

Description
Update PlatformIO Account profile.

Options
You can omit these options and enter them later in update Wizard.

--username, -u
A username that must contain at least 4 characters including single hyphens, and cannot begin or end with a hyphen.

--email, -e
An email. Please enter existing email, you will receive a confirmation letter.

--firstname
A first name.

--lastname
A last name.

--current-password
A current password to confirm this operation.

pio boards

Contents

• pio boards
  – Usage
  – Description
Usage

`pio boards [OPTIONS] [FILTER]`

Description

List pre-configured Embedded Boards

Options

`--installed`
List boards only from the installed platforms

`--json-output`
Return the output in JSON format

Examples

1. Show all available pre-configured embedded boards

   ```
   > pio boards
   Platform: atmelavr
   # ID     MCU       Frequency  Flash  RAM  Name
   #----------------------------------------------------------
   # btatmega168 atmega168 16MHz  14K  1K  Arduino BT ATmega168
   # btatmega328 atmega328p 16MHz  28K  2K  Arduino BT ATmega328
   # diecimilaatmega168 atmega168 16MHz  14K  1K  Arduino Duemilanove or
   #  → Diecimila ATmega168
   # diecimilaatmega328 atmega328p 16MHz  30K  2K  Arduino Duemilanove or
   #  → Diecimila ATmega328
   # esplora atmega32u4 16MHz  28K  2K  Arduino Esplora
   # ethernet atmega328p 16MHz  31K  2K  Arduino Ethernet
   # ...
   ```

2. Filter Arduino-based boards

   ```
   > pio boards arduino
   Platform: atmelavr
   # ID     MCU       Frequency  Flash  RAM  Name
   #----------------------------------------------------------
   # btatmega168 atmega168 16MHz  14K  1K  Arduino BT ATmega168
   # btatmega328 atmega328p 16MHz  28K  2K  Arduino BT ATmega328
   ```

(continues on next page)
3. Filter mbed-enabled boards

```bash
> pio boards mbed
```

**pio check**

Helper command for **Static Code Analysis.**

**Contents**

- **pio check**
  - Usage
  - Description
  - Options
  - Examples
Usage

```
pio check [OPTIONS]
```

Description

Perform static analysis check on PlatformIO based project. By default Cppcheck analysis tool is used.

Options

`-e, --environment`
Process specified environments.

`--pattern`
You can specify which source files or folders should be included/excluded from check process. By default only `src_dir` and `include_dir` are checked. Multiple `--pattern` options and GLOB Patterns are allowed.
Example: `pio check --pattern="tests" --pattern="src/*.cpp"

`--flags`
Specify additional flags that need to be passed to the analysis tool. If multiple tools set in `check_tool` option, the flags are passed to all of them. Individual flags for each tool can be added using a special suffix with the tool name.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>--addon=&lt;addon&gt;</td>
<td>Execute addon. i.e. cert.</td>
</tr>
<tr>
<td>-D&lt;ID&gt;</td>
<td>Define preprocessor symbol.</td>
</tr>
</tbody>
</table>

Multiple `--flags` options are allowed.
Example: `pio check --flags "-DDEBUG cppcheck: --std=c++11 --platform=avr8"

`--severity`
Specify the Defect severity types which will be reported by the Check tools. Possible values described in Defect severity section. Multiple `--severity` options are allowed.
Example: `pio check --severity=high`

`-d, --project-dir`
Specify the path to project directory. By default, `--project-dir` is equal to the current working directory (CWD).

`-c, --project-conf`
Process project with a custom “platformio.ini” (Project Configuration File).

`--json-output`
Return the output in JSON format.

`--fail-on-defect

1.3. PlatformIO Core (CLI)
Fail (exit with non-zero code) if there is a defect found with specified severity. By default exit code is the same as the exit code returned by a tool selected for performing check. Possible values described in *Defect severity* section. Multiple `--fail-on-defect` options are allowed.

Example: `pio check --fail-on-defect=low --fail-on-defect=medium`

`-s, --silent`
Suppress progress reporting and show only defects with high severity. See *Defect severity*.

`-v, --verbose`
Show detailed information when processing environments.

This option can also be set globally using `force_verbose` setting or by environment variable `PLATFORMIO_SETTING_FORCE_VERBOSE`.

**Examples**

For the examples please follow to *Static Code Analysis* page.

`pio ci`

**Contents**

- `pio ci`
  - *Usage*
  - *Description*
  - *Options*
  - *Examples*

**Usage**

`pio ci [OPTIONS] [SRC]`

**Description**

`pio ci` command is conceived of as “hot key” for building project with arbitrary source code structure. In a nutshell, using SRC and `pio ci --lib` contents PlatformIO initializes via `pio project init` new project in `pio ci --build-dir` with the build environments (using `pio ci --board` or `pio ci --project-conf`) and processes them via `pio run` command.

`pio ci` command accepts multiple SRC arguments, `pio ci --lib` and `pio ci --exclude` options which can be a path to directory, file or *Glob Pattern*. Also, you can omit SRC argument and set path (multiple paths are allowed denoting with :) to `PLATFORMIO_CI_SRC` Environment variable.

For more details as for integration with the popular Continuous Integration Systems please follow to *Continuous Integration* page.
Note: `pio ci` command is useful for library developers. It allows one to build different examples without creating own project per them. Also, it is possible to upload firmware to the target device. In this case, you need to pass additional option `--project-option="targets=upload"`. What is more, you can specify custom upload port using `--project-option="upload_port=<port>"` option. See `pio ci --project-option` for details.

### Options

-b, --board
Build project with automatically pre-generated environments based on board settings.
For more details please look into `pio project init --board`.

--build-dir
Path to directory where PlatformIO will initialise new project. By default it’s temporary directory within your operating system.

Note: This directory will be removed at the end of build process. If you want to keep it, please use `pio ci --keep-build-dir`.

--keep-build-dir
Don’t remove `pio ci --build-dir` after build process.

-O, --project-option
Pass additional options from “platformio.ini” (Project Configuration File) to `pio project init` command. For example, automatically install dependent libraries `pio ci --project-option="lib_deps=ArduinoJSON"` or ignore specific library `pio ci --project-option="lib_ignore=SomeLib"`.

Note: Use multiple `--project-option` to pass multiple options to “platformio.ini” (Project Configuration File). One option per one argument. For example, `pio ci --project-option="build_unflags =`
-std=gnu++11" --project-option="build_flags = -std=c++14"

-\texttt{v, --verbose}

Shows detailed information when processing environments.
This option can also be set globally using \texttt{force_verbose} setting or by environment variable \texttt{PLATFORMIO_SETTING_FORCE_VERBOSE}.

\section*{Examples}

For the others examples please follow to \textit{Continuous Integration} page.

\texttt{pio debug}

Helper command for \textit{Debugging}.

\section*{Contents}

- \texttt{pio debug}
  - \textit{Usage}
  - \textit{Description}
  - \textit{Options}
  - \textit{Examples}

\section*{Usage}

\begin{verbatim}
pio debug [OPTIONS]
\end{verbatim}

\begin{verbatim}
# A binary shortcut for "pio debug --interface=gdb" command
piodebuggdb [GDB OPTIONS]
\end{verbatim}

\section*{Description}

Prepare PlatformIO project for debugging or launch debug server.

\section*{Options}

-\texttt{e, --environment}

Debug specified environments.
You can also specify which environments should be used for debugging by default using \texttt{default_envs} option from \texttt{"platformio.ini"} (Project Configuration File).

-\texttt{d, --project-dir}

Specify the path to a project directory. By default, \texttt{--project-dir} is equal to a current working directory (CWD).
-c, --project-conf

Process project with a custom “platformio.ini” (Project Configuration File).

--interface

PlatformIO Debugging Interface. Valid values:

- gdb - GDB: The GNU Project Debugger

-v, --verbose

Shows detailed information when processing environments.

This option can also be set globally using force_verbose setting or by environment variable PLATFORMIO_SETTING_FORCE_VERBOSE.

Examples

1. Prepare a project for debugging

```
> pio debug

[Sun Apr 30 01:34:01 2017] Processing mzeropro (platform: atmelsam; debug_extra_cmds: b main.cpp:26; board: mzeropro; framework: arduino)

Device Manager CLI

To print all available commands and options use:

```
pio device --help
pio device COMMAND --help
```

**pio device list**

**Contents**

- **pio device list**
  - **Usage**
  - **Description**
  - **Options**
  - **Examples**

**Usage**

```
pio device list [OPTIONS]
```

**Description**

List available devices. Default is set to `--serial` and all available Serial Ports will be shown.

**Options**

- **--serial**
  List available Serial Ports, default.
- **--logical**
  List available logical devices.
- **--mdns**
  List multicast DNS services.
**--json-output**

Return the output in **JSON** format.

**Examples**

1. **Unix OS**

   ```
   > pio device list
   /dev/cu.SLAB_USBtoUART
   ----------
   Hardware ID: USB VID:PID=10c4:ea60 SNR=0001
   Description: CP2102 USB to UART Bridge Controller
   
   /dev/cu.uart-1CFF4676258F4543
   ----------
   Hardware ID: USB VID:PID=451:f432 SNR=1CFF4676258F4543
   Description: Texas Instruments MSP-FET430UIF
   ```

2. **Windows OS**

   ```
   > pio device list
   COM4
   ----------
   Hardware ID: USB VID:PID=0451:F432
   Description: MSP430 Application UART (COM4)

   COM3
   ----------
   Hardware ID: USB VID:PID=10C4:EA60 SNR=0001
   Description: Silicon Labs CP210x USB to UART Bridge (COM3)
   ```

3. **List multicast DNS services and logical devices**

   ```
   > pio device list --mdns --logical
   Multicast DNS Services

  - Device Monitor Filter API
  - Examples

Usage

pio device monitor [OPTIONS]

Description

This is a console application that provides a small terminal application. It is based on Miniterm and itself does not implement any terminal features such as VT102 compatibility. However it inherits these features from the terminal it is run. For example on GNU/Linux running from an xterm it will support the escape sequences of the xterm. On
Windows the typical console window is dumb and does not support any escapes. When ANSI.sys is loaded it supports some escapes.

Miniterm supports RFC 2217 remote serial ports and raw sockets using URL Handlers such as rfc2217://<host>:<port> respectively socket://<host>:<port> as port argument when invoking.

To control monitor please use these “hot keys”:

- Ctrl+C Quit
- Ctrl+T Menu
- Ctrl+T followed by Ctrl+H Help

**Options**

-p, --port
Port, a number or a device name, or valid URL Handlers.

Can be customized in “platformio.ini” (Project Configuration File) using monitor_port option.

**URL Handlers**

- rfc2217://<host>:<port>[?<option> [&<option> ...]]
- socket://<host>:<port>[?logging={debug|info|warning|error}]
- loop://[?logging={debug|info|warning|error}]
- hwgrep://<regexp>[&skip_busy][&n=N]
- spy://port[?option=value [&option=value]]
- alt://port?class=<classname>

-b, --baud
Set baud rate, default 9600.

Can be customized in “platformio.ini” (Project Configuration File) using monitor_speed option.

--parity
Set parity (None, Even, Odd, Space, Mark), one of [N, E, O, S, M], default N

--rtscts
Enable RTS/CTS flow control, default Off

--xonxoff
Enable software flow control, default Off

--rts
Set initial RTS line state (0 or 1).

Can be customized in “platformio.ini” (Project Configuration File) using monitor_rts option.

--dtr
Set initial DTR line state (0 or 1).

Can be customized in “platformio.ini” (Project Configuration File) using monitor_dtr option.

--echo
Enable local echo, default Off

---encoding
Set the encoding for the serial port (e.g. hexlify, Latin1, UTF-8), default UTF-8.

--filter
Add text transformation. See available filters at Filters.

--eol
End of line mode (CR, LF or CRLF), default CRLF

NEW: Available in Miniterm/PySerial 3.0

--raw
Do not apply any encodings/transformations

--exit-char
ASCII code of special character that is used to exit the application, default 3 (DEC, Ctrl+C).

For example, to use Ctrl+] run pio device monitor --exit-char 29.

--menu-char
ASCII code of special character that is used to control miniterm (menu), default 20 (DEC)

---quiet
Diagnostics: suppress non-error messages, default Off

-d, --project-dir
Specify the path to project directory. By default, --project-dir is equal to current working directory (CWD).

-e, --environment
Process specified environments.

You can also specify which environments should be processed by default using default_envs option from “platformio.ini” (Project Configuration File).

Filters

A list of filters that can be applied for monitor output using pio device monitor --filter or “platformio.ini” (Project Configuration File) and monitor_filters options.
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default</td>
<td>Remove typical terminal control codes from input</td>
</tr>
<tr>
<td>colorize</td>
<td>Apply different colors for received and echo</td>
</tr>
<tr>
<td>debug</td>
<td>Print what is sent and received</td>
</tr>
<tr>
<td>direct</td>
<td>Do-nothing: forward all data unchanged</td>
</tr>
<tr>
<td>hexlify</td>
<td>Show a hexadecimal representation of the data (code point of each character)</td>
</tr>
<tr>
<td>log2file</td>
<td>Log data to a file “platformio-device-monitor-%date%.log” located in the current working directory</td>
</tr>
<tr>
<td>nocontrol</td>
<td>Remove all control codes, incl. CR+LF</td>
</tr>
<tr>
<td>printable</td>
<td>Show decimal code for all non-ASCII characters and replace most control codes</td>
</tr>
<tr>
<td>time</td>
<td>Add timestamp with milliseconds for each new line</td>
</tr>
<tr>
<td>send_on_enter</td>
<td>Send a text to device on ENTER</td>
</tr>
<tr>
<td>esp32_exception_decoder</td>
<td>Custom filter for Espressif 32 which decodes crash exception</td>
</tr>
<tr>
<td>esp8266_exception_decoder</td>
<td>Custom filter for Espressif 8266 which decodes crash exception</td>
</tr>
</tbody>
</table>

**Capture output to a file**

You need to use a `log2file` filter from *Filters*:

```plaintext
> pio device monitor -f log2file -f default
```

or using “`platformio.ini`” *(Project Configuration File)* and *monitor_filters*

```plaintext
[env:log_output_to_file]
...
platform = ...
monitor_filters = log2file, default
```

**Device Monitor Filter API**

*PlatformIO Core (CLI)* provides an API to extend device monitor with a custom filter declared in “monitor” folder of *Development Platforms*. See examples:

- [https://github.com/platformio/platform-espressif32/tree/develop/monitor](https://github.com/platformio/platform-espressif32/tree/develop/monitor)
- [https://github.com/platformio/platform-espressif8266/tree/develop/monitor](https://github.com/platformio/platform-espressif8266/tree/develop/monitor)

**Examples**

1. Show available options for `monitor`

```plaintext
> pio device monitor --help
Usage: pio device monitor [OPTIONS]

Options:
    -p, --port TEXT          Port, a number or a device name
    -b, --baud INTEGER       Set baud rate, default=9600
    --parity [N|E|O|S|M]     Set parity, default=N
    --rtscts                 Enable RTS/CTS flow control, default=Off
    --xonxoff                Enable software flow control, default=Off
    --rts [0|1]              Set initial RTS line state, default=0
```

(continues on next page)
2. Communicate with serial device and print help inside terminal

> pio device monitor

--- Available ports:
--- /dev/cu.Bluetooth-Incoming-Port n/a
--- /dev/cu.Bluetooth-Modem n/a
--- /dev/cu.SLAB_USBtoUART CP2102 USB to UART Bridge Controller

---
--- Port settings (Ctrl+T followed by the following):
--- p change port
--- 7 8 set data bits
--- n e o s m change parity (None, Even, Odd, Space, Mark)
--- 1 2 3 set stop bits (1, 2, 1.5)
--- b change baud rate
--- x X disable/enable software flow control
--- r R disable/enable hardware flow control
--- exit ---

pio home

Helper command for PlatformIO Home.
Contents

- pio home
  - Usage
  - Description
  - Options
  - Examples

Usage

pio home

Description

Launch PlatformIO Home Web-server.

Options

--port
Web-server HTTP port, default is 8008.

--host
Web-server HTTP host, default is 127.0.0.1. You can open PlatformIO Home for inbound connections using host 0.0.0.0.

--no-open
Do not automatically open PlatformIO Home in a system Web-browser.

--shutdown-timeout
Automatically shutdown server on timeout (in seconds) when no clients are connected. Default is 0 which means never auto shutdown.

Examples

> pio home

___I__
/\-__\ PlatformIO Home
/ \_-__\ [][[]] | http://127.0.0.1:8008
|__|___|_________________________

Open PlatformIO Home in your browser by this URL => http://127.0.0.1:8008
PlatformIO Home has been started. Press Ctrl+C to shutdown.
Library Manager CLI

Usage

# To print all available commands and options use
pio lib --help
pio lib COMMAND --help

Options

-d, --storage-dir
Manage custom library storage. It can be used later for the `lib_extra_dirs` option from "platformio.ini" (Project Configuration File). Multiple options are allowed.

-g, --global
Manage global PlatformIO’s library storage ("core_dir/lib") where Library Dependency Finder (LDF) will look for dependencies by default.

-e, --environment
Manage libraries for the specific project build environments declared in "platformio.ini" (Project Configuration File). Works for --storage-dir which is valid PlatformIO project.

Demo

Commands

pio lib builtin

Contents

* pio lib builtin
  * Usage
  * Description
  * Options
  * Examples

Usage

pio lib builtin [OPTIONS]
Description

List built-in libraries based on installed Development Platforms and their frameworks, SDKs, etc.

Options

--storage
List libraries from specified storages. For example, framework-arduinoavr.

--json-output
Return the output in JSON format

Examples

> pio lib builtin
framework-arduinoavr
********************
Bridge
======
Enables the communication between the Linux processor and the microcontroller. For Arduino/Genuino Yún, Yún Shield and TRE only.

Version: 1.6.1
Homepage: http://www.arduino.cc/en/Reference/YunBridgeLibrary
Keywords: communication
Compatible frameworks: arduino
Compatible platforms: *
Authors: Arduino

EEPROM
======
Enables reading and writing to the permanent board storage.

Version: 2.0
Homepage: http://www.arduino.cc/en/Reference/EEPROM
Keywords: data, storage
Compatible frameworks: arduino
Compatible platforms: atmelavr
Authors: Arduino, Christopher Andrews

framework-arduinosam
********************
Audio
====
Allows playing audio files from an SD card. For Arduino DUE only.

Version: 1.0

(continues on next page)
SPI
===
Enables the communication with devices that use the Serial Peripheral Interface (SPI) → Bus. For all Arduino boards, BUT Arduino DUE.

Version: 1.0
Keywords: signal, input, output
Compatible frameworks: arduino
Compatible platforms: atmelsam
Authors: Hristo Gochkov

framework-arduinoespressif8266
******************************

ArduinoOTA
==========
Enables Over The Air upgrades, via wifi and espota.py UDP request/TCP download.

Version: 1.0
Keywords: communication
Compatible frameworks: arduino
Compatible platforms: espressif8266
Authors: Ivan Grokhokov and Miguel Angel Ajo

DNSServer
========= A simple DNS server for ESP8266.

Version: 1.1.0
Keywords: communication
Compatible frameworks: arduino
Compatible platforms: espressif8266
Authors: Kristijan Novoselić

Adafruit NeoPixel
=================
Arduino library for controlling single-wire-based LED pixels and strip.
Version: 1.0.3
Homepage: https://github.com/adafruit/Adafruit_NeoPixel
Keywords: display
Compatible frameworks: arduino
Compatible platforms: *
Authors: Adafruit

CurieBLE
========
Library to manage the Bluetooth Low Energy module with Curie Core boards.

Version: 1.0
Keywords: communication
Compatible frameworks: arduino
Compatible platforms: intel_arc32
Authors: Emutex

CurieEEPROM
============
Enables reading and writing to OTP flash area of Curie

Version: 1.0
Homepage: http://www.arduino.cc/en/Reference/EEPROM
Keywords: data, storage
Compatible frameworks: arduino
Compatible platforms: intel_arc32
Authors: Intel

framework-arduinomicrochippic32
********************************

Firmata
=======
Enables the communication with computer apps using a standard serial protocol. For all Arduino boards.

Version: 2.4.4
Homepage: https://github.com/firmata/arduino
Keywords: device, control
Compatible frameworks: arduino
Compatible platforms: *
Authors: Firmata Developers

framework-arduinoteensy
************************

Adafruit CC3000 Library
************************
Library code for Adafruit's CC3000 WiFi breakouts.

Version: 1.0.1
Homepage: https://github.com/adafruit/Adafruit_CC3000_Library
Keywords: communication
Compatible frameworks: arduino
Compatible platforms: *
Authors: Adafruit

framework-energiamsp430
************************

AIR430BoostEuropeETSI
=====================
Library for the CC110L Sub-1GHz radio BoosterPack for use in Europe

Version: 1.0.0
Homepage: http://energia.nu/reference/libraries/
Keywords: communication
Compatible frameworks: arduino
Compatible platforms:
Authors: Energia

framework-energiativa
************************
aJson
======
An Arduino library to enable JSON processing with Arduino

Keywords: json, rest, http, web
Compatible frameworks: arduino
Compatible platforms: atmelavr

pio lib install

Contents

- pio lib install
  - Usage
  - Description
  - Storage Options
  - Options
  - Version control
    - Git
    - Mercurial
    - Subversion
  - Examples
Usage

```shell
pio lib [STORAGE_OPTIONS] install [OPTIONS] [LIBRARY...]  
```

# RECOMMENDED
# install all project dependencies declared via "lib_deps"
# (run it from a project root where is located "platformio.ini")
```shell
pio lib install [OPTIONS]
```

# install project dependent library
# (run it from a project root where is located "platformio.ini")
```shell
pio lib install [OPTIONS] [LIBRARY...]
```

# install dependencies for the specific project environment
# (run it from a project root where is located "platformio.ini")
```shell
pio lib -e myenv install [OPTIONS] [LIBRARY...]
pio lib -d /path/to/platformio/project -e myenv install [OPTIONS] [LIBRARY...]
```

# install to global storage (NOT RECOMMENDED)
```shell
pio lib --global install [OPTIONS] [LIBRARY...]
PIO lib -g install [OPTIONS] [LIBRARY...]
```

# install to custom storage
```shell
pio lib --storage-dir /path/to/dir install [OPTIONS] [LIBRARY...]
pio lib -d /path/to/dir1 -d /path/to/dir2 install [OPTIONS] [LIBRARY...]
```

# [LIBRARY...] forms
```shell
pio lib [STORAGE_OPTIONS] install (with no args, install project dependencies from "lib_deps")
pio lib [STORAGE_OPTIONS] install <ownername/name>
pio lib [STORAGE_OPTIONS] install <ownername/name>@<version>
pio lib [STORAGE_OPTIONS] install <ownername/name>@<version range>
pio lib [STORAGE_OPTIONS] install <zip or tarball url>
pio lib [STORAGE_OPTIONS] install file://<zip or tarball file>
pio lib [STORAGE_OPTIONS] install file://<folder>
pio lib [STORAGE_OPTIONS] install <repository>
pio lib [STORAGE_OPTIONS] install <repository#tag> ("tag" can be commit, branch or tag)
```

---

**Warning:** If some libraries are not visible in *PlatformIO IDE* and Code Completion or Code Linting does not work properly, please perform

- **VSCode:** “Menu: View > Command Palette… > PlatformIO: Rebuild C/C++ Project Index”

---

**Description**

Install a library, and any libraries that it depends on using:

1. PlatformIO Library Registry
2. Custom folder, repository or archive.

The version supports **Semantic Versioning** (**<major>**.<**minor**>.<**patch**>) and can take any of the following forms:
• ^1.2.3 - any compatible version (new functionality in a backwards compatible manner and patches are allowed, 1.x.x). **RECOMMENDED**
• ~1.2.3 - any version with the same major and minor versions, and an equal or greater patch version
• >1.2.3 - any version greater than 1.2.3. >=, <, and <= are also possible
• >0.1.0, !=0.2.0, <0.3.0 - any version greater than 0.1.0, not equal to 0.2.0 and less than 0.3.0
• 1.2.3 - an exact version number. Use only this exact version.

PlatformIO supports installing from local directory or archive. You need to use `file://` prefix before local path.

- `file://local/path/to/the/platform/dir`
- `file://local/path/to/the/platform.zip`
- `file://local/path/to/the/platform.tar.gz`

### Storage Options

See base options for *Library Manager CLI*.

### Options

---save / --no-save

Save installed libraries into the “platformio.ini” (*Project Configuration File*) dependency list (*lib_deps*). Default value is to save.

You can save libraries for the specific project environment using `-e, --environment` option from `pio lib` command. For example, `pio lib -e myenv install [LIBRARY...]`.

-s, --silent

Suppress progress reporting.

-f, --force

Reinstall library if it is already installed.

### Version control

PlatformIO supports installing from Git, Mercurial and Subversion, and detects the type of VCS using url prefixes: “git+”, “hg+”, or “svn+”.

**Note:** PlatformIO requires a working VCS command on your path: `git`, `hg` or `svn`.

### Git

The supported schemes are: `git`, `git+https` and `git+ssh`. Here are the supported forms:

- `https://github.com/user/library.git`
- `git+git://git.server.org/my-library`
- `git+https://git.server.org/my-library`
- `git+ssh://git.server.org/my-library`
- `git+ssh://user@git.server.org/my-library`
- `[user@]host.xz:path/to/repo.git`

Passing branch names, a commit hash or a tag name is possible like so:
- `https://github.com/user/library.git#master`
- `git+git://git.server.org/my-library#master`
- `git+https://git.server.org/my-library#v1.0`
- `git+ssh://git.server.org/my-library#7846d8ad52f983f2f2887bdc0f073fe9755a806d`

**Mercurial**

The supported schemes are: `hg+http`, `hg+https` and `hg+ssh`. Here are the supported forms:
- `https://developer.mbed.org/users/user/code/library/` (install ARM mbed library)
- `hg+hg://hg.server.org/my-library`
- `hg+https://hg.server.org/my-library`
- `hg+ssh://hg.server.org/my-library`

Passing branch names, a commit hash or a tag name is possible like so:
- `hg+hg://hg.server.org/my-library#master`
- `hg+https://hg.server.org/my-library#v1.0`
- `hg+ssh://hg.server.org/my-library#4cfe2fa00668`

**Subversion**

The supported schemes are: `svn`, `svn+svn`, `svn+http`, `svn+https` and `svn+ssh`. Here are the supported forms:
- `svn+svn://svn.server.org/my-library`
- `svn+https://svn.server.org/my-library`
- `svn+ssh://svn.server.org/my-library`

You can also give specific revisions to an SVN URL, like so:
- `svn+svn://svn.server.org/my-library#13`

**Examples**

1. Install the latest version of library to a global storage using ID or NAME

```
> pio lib -g install 4
Library Storage: /storage/dir/...
LibraryManager: Installing id=4
Downloading [####################################] 100%
Unpacking [####################################] 100%
```

(continues on next page)
IRremote @ 2.2.1 has been successfully installed!

# repeat command with name
> pio lib -g install IRRemote

Library Storage: /storage/dir/...
Looking for IRRemote library in registry
Found: https://platformio.org/lib/show/4/IRremote
LibraryManager: Installing id=4
IRremote @ 2.2.1 is already installed

2. Install specified version of a library to a global storage

> pio lib -g install ArduinoJson@5.6.7

Library Storage: /storage/dir/...
Looking for ArduinoJson library in registry
Found: https://platformio.org/lib/show/64/ArduinoJson
LibraryManager: Installing id=64 @ 5.6.7
Downloading [####################################] 100%
Unpacking [####################################] 100%
ArduinoJson @ 5.6.7 has been successfully installed!

3. Install library with dependencies to custom storage

> pio lib --storage-dir /my/storage/dir install DallasTemperature

Library Storage: /my/storage/dir
Looking for DallasTemperature library in registry
Found: https://platformio.org/lib/show/54/DallasTemperature
LibraryManager: Installing id=54
Downloading [####################################] 100%
Unpacking [####################################] 100%
DallasTemperature @ 3.7.7 has been successfully installed!
Installing dependencies
Looking for OneWire library in registry
Found: https://platformio.org/lib/show/1/OneWire
LibraryManager: Installing id=1
Downloading [####################################] 100%
Unpacking [####################################] 100%
OneWire @ 8fd2ebfecd has been successfully installed!

4. Install ARM mbed library to the global storage

> pio lib -g install https://developer.mbed.org/users/simon/code/TextLCD/

Library Storage: /storage/dir/...
LibraryManager: Installing TextLCD
Mercurial Distributed SCM (version 3.8.4)
(see https://mercurial-scm.org for more information)

  - Description
  - Storage Options
  - Options
  - Examples

Usage

pio lib [STORAGE_OPTIONS] list [OPTIONS]

# list project dependent libraries
# (run it from a project root where is located "platformio.ini")
pio lib list [OPTIONS]

# list libraries from global storage
pio lib --global list [OPTIONS]
pio lib -g list [OPTIONS]

# list libraries from custom storage
pio lib --storage-dir /path/to/dir list [OPTIONS]
pio lib -d /path/to/dir list [OPTIONS]

Description

List installed libraries
Storage Options

See base options for *Library Manager CLI*.

Options

`--json-output`

Return the output in **JSON** format

Examples

```bash
> pio lib -g list

Library Storage: /storage/dir/...

Adafruit Unified Sensor
-----------------------
#ID: 31
Required **for all** Adafruit Unified Sensor based libraries.

Version: **1.0.2**
Keywords: sensors
Compatible frameworks: arduino
Compatible platforms: atmelavr, atmelsam, espressif8266, intel_arc32, microchippic32, ...
  → nordicnrf51, teensy, timsp430
Authors: Adafruit

ArduinoJson
============
#ID: 64
An elegant and efficient JSON library **for** embedded systems

Version: **5.8.0**
Keywords: web, json, http, rest
Compatible frameworks: arduino
Compatible platforms: atmelavr, atmelsam, espressif8266, intel_arc32, microchippic32, ...
  → nordicnrf51, teensy, timsp430
Authors: Benoit Blanchon

ArduinoJson
============
#ID: 64
An elegant and efficient JSON library **for** embedded systems

Version: **5.6.7**
Keywords: web, json, http, rest
Compatible frameworks: arduino
Compatible platforms: atmelavr, atmelsam, espressif8266, intel_arc32, microchippic32, ...
  → nordicnrf51, teensy, timsp430
Authors: Benoit Blanchon

ArduinoJson
============
#ID: 64
```
An elegant and efficient JSON library for embedded systems

Version: 5.7.2
Keywords: web, json, http, rest
Compatible frameworks: arduino
Compatible platforms: atmelavr, atmelsam, espressif8266, intel_arc32, microchippic32, nordicnrf51, teensy, timsp430
Authors: Benoit Blanchon

Blynk
======
#ID: 415

Build a smartphone app for your project in minutes. Blynk allows creating IoT solutions easily. It supports WiFi, BLE, Bluetooth, Ethernet, GSM, USB, Serial. Works with many boards like ESP8266, ESP32, Arduino UNO, Nano, Due, Mega, Zero, MKR1000, Yun, Raspberry Pi, Particle, Energia, ARM mbed, Intel Edison/Galileo/Joule, BBC micro:bit, DFRobot, RedBearLab, Microduino, LinkIt ONE ...

Version: 0.4.3
Homepage: http://blynk.cc
Keywords: control, gprs, protocol, communication, app, bluetooth, serial, cloud, web, us, m2m, ble, 3g, smartphone, http, iot, device, sensors, data, esp8266, mobile, wifi, ethernet, gsm
Compatible frameworks: energia, wiringpi, arduino
Compatible platforms: atmelavr, atmelsam, espressif8266, intel_arc32, linux_arm, microchippic32, nordicnrf51, teensy, timsp430, titiva
Authors: Volodymyr Shymanskyy

Bounce2
=======
#ID: 1106

Debouncing library for Arduino or Wiring

Version: 2.1
Keywords: input, signal, output, bounce
Compatible frameworks: arduino
Compatible platforms: atmelavr, atmelsam, espressif8266, intel_arc32, microchippic32, nordicnrf51, teensy, timsp430
Authors: Thomas O Fredericks

Homie
=====
#ID: 555

ESP8266 framework for Homie, a lightweight MQTT convention for the IoT

Version: 1.5.0
Keywords: home, mqtt, iot, esp8266, automation
Compatible frameworks: arduino
Compatible platforms: espressif8266
Authors: Marvin Roger

JustWifi
=======
#ID: 1282

Wifi Manager for ESP8266 that supports multiple wifi networks and scan for strongest signal
LiquidCrystal
==============

**Version:** 1.1.1
**License:** GPL-3.0
**Keywords:** manager, wifi, scan
**Compatible frameworks:** arduino
**Compatible platforms:** espressif8266
**Authors:** Xose Perez

LiquidCrystal Library is faster **and** extensible, compatible **with** the original_

---

**Version:** 1.3.4
**Keywords:** lcd, hd44780
**Compatible frameworks:** arduino
**Compatible platforms:** atmelavr
**Authors:** F Malpartida

TextLCD
=======

**Version:** 308d188a2d3a
**Keywords:** uncategorized

**Time**

**Version:** 1.5
**Homepage:** http://playground.arduino.cc/Code/Time
**Keywords:** week, rtc, hour, year, month, second, time, date, day, minute
**Compatible frameworks:** arduino
**Compatible platforms:**
**Authors:** Michael Margolis, Paul Stoffregen

Timezone
========

**Version:** 510ae2f6b6
**Keywords:** zone, time
**Compatible frameworks:** arduino
**Compatible platforms:** atmelavr
**Authors:** Jack Christensen

U8g2
====

**Version:** 942
**Keywords:** Monochrome LCD, OLED and eInk Library. Display controller: SSD1305, SSD1306, SSD1322, SSD1325, SSD1327, SSD1606, SH1106, T6963, RA8835, LC7981, PCD8544, PCF8812, UC1604, UC1608, UC1610, UC1611, UC1701, ST7565, ST7567, NT7534, ST7920, LD7032, KS0108.
**Interfaces:** I2C, SPI, Parallel.
Version: **2.11.4**

**Contents**

- **pio lib search**
  - **Usage**
  - **Description**
  - **Options**
  - **Examples**

**Usage**

```
pio lib search [OPTIONS] [QUERY]
```

**Description**

Search for library in PlatformIO Library Registry by `library.json` fields in the boolean mode.
The boolean search capability supports the following operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>A leading or trailing plus sign indicates that this word must be present in library fields (see above) that is returned.</td>
</tr>
<tr>
<td>-</td>
<td>A leading or trailing minus sign indicates that this word must not be present in any of the libraries that are returned.</td>
</tr>
<tr>
<td>(no operator)</td>
<td>By default (when neither + nor - is specified), the word is optional, but the libraries that contain it are rated higher.</td>
</tr>
<tr>
<td>&gt; &lt;</td>
<td>These two operators are used to change a word’s contribution to the relevance value that is assigned to a library. The &gt; operator increases the contribution and the &lt; operator decreases it.</td>
</tr>
<tr>
<td>( )</td>
<td>Parentheses group words into subexpressions. Parenthesized groups can be nested.</td>
</tr>
<tr>
<td>~</td>
<td>A leading tilde acts as a negation operator, causing the word’s contribution to the library’s relevance to be negative. This is useful for marking “noise” words. A library containing such a word is rated lower than others, but is not excluded altogether, as it would be with the – operator.</td>
</tr>
<tr>
<td>*</td>
<td>The asterisk serves as the truncation (or wildcard) operator. Unlike the other operators, it is appended to the word to be affected. Words match if they begin with the word preceding the + operator.</td>
</tr>
<tr>
<td>&quot;</td>
<td>A phrase that is enclosed within double quote (&quot;) characters matches only libraries that contain the phrase literally, as it was typed.</td>
</tr>
</tbody>
</table>

For more detail information please go to MySQL Boolean Full-Text Searches.

**Options**

---id
Filter libraries by registry ID

--n, --name
Filter libraries by specified name (strict search)

--a, --author
Filter libraries by specified author

--k, --keyword
Filter libraries by specified keyword

--f, --framework
Filter libraries by specified framework

--p, --platform
Filter libraries by specified keyword

--i, --header
Filter libraries by header file (include)

For example, pio lib search --header "OneWire.h"

--json-output
Return the output in JSON format

--page
Examples

1. List all libraries

```bash
> pio lib search

Found N libraries:

ArduinoJson
=============
#ID: 64
An elegant and efficient JSON library for embedded systems
Keywords: web, json, http, rest
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 8266, Intel ARC32, Microchip, PIC32, Nordic nRF51, Teensy, TI MSP430
Authors: Benoit Blanchon

DHT sensor library
==================
#ID: 19
Arduino library for DHT11, DHT22, etc Temp & Humidity Sensors
Keywords: unified, dht, sensor, temperature, humidity
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Adafruit Industries

PubSubClient
============
#ID: 89
A client library for MQTT messaging. MQTT is a lightweight messaging protocol ideal for small devices. This library allows you to send and receive MQTT messages. It supports the latest MQTT 3.1.1 protocol and can be configured to use the older MQTT 3.1...
Keywords: ethernet, mqtt, iot, m2m
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 8266, Intel ARC32, Microchip, PIC32, Nordic nRF51, Teensy, TI MSP430
Authors: Nick O'Leary

ESPAsyncWebServer
==================
#ID: 306
Asynchronous HTTP and WebSocket Server Library for ESP8266 and ESP32
Keywords: async, websocket, http, webserver
Compatible frameworks: Arduino
Compatible platforms: Espressif 8266
Authors: Hristo Gochkov
```
(continues on next page)
2. Search for 1-Wire libraries

```
> pio lib search "1-wire"
```

```
Found N libraries:

DS1820
======
#ID: 196
Dallas / Maxim DS1820 1-Wire library. For communication with multiple DS1820 on a
--single 1-Wire bus. Also supports DS18S20 and DS18B20.
Keywords: ds18s20, 1-wire, ds1820, ds18b20
Compatible frameworks: mbed
Compatible platforms: Freescale Kinetis, Nordic nRF51, NXP LPC, ST STM32, Teensy
Authors: Michael Hagberg
```

```
OneWire
=======
#ID: 1
Control 1-Wire protocol (DS18S20, DS18B20, DS2408 and etc)
Keywords: onewire, temperature, bus, 1-wire, ibutton, sensor
Compatible frameworks: Arduino
Compatible platforms:
Authors: Paul Stoffregen, Jim Studt, Tom Pollard, Derek Yerger, Josh Larios, Robin
--James, Glenn Trewitt, Jason Dangel, Guillermo Lovato, Ken Butcher, Mark Tillotson,
--Bertrik Sikken, Scott Roberts
```

Show next libraries? [y/N]: ...

3. Search for Arduino-based “I2C” libraries

```
> pio lib search "i2c" --framework="arduino"
```

```
Found N libraries:

I2Cdevlib-AK8975
================
#ID: 10
AK8975 is 3-axis electronic compass IC with high sensitive Hall sensor technology
Keywords: i2c, i2cdevlib, sensor, compass
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Jeff Rowberg
```

```
I2Cdevlib-Core
==============
#ID: 11
The I2C Device Library (I2Cdevlib) is a collection of uniform and well-documented,
--classes to provide simple and intuitive interfaces to I2C devices.
```

(continues on next page)
Keywords: i2cdevlib, i2c
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Jeff Rowberg

Adafruit 9DOF Library
=====================
#ID: 14
Unified sensor driver for the Adafruit 9DOF Breakout (L3GD20 / LSM303)

Keywords: magnetometer, unified, accelerometer, spi, compass, i2c, sensor, gyroscope
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Adafruit Industries

Show next libraries? [y/N]: ...

4. Search for libraries by “web” and “http” keywords.

> pio lib search --keyword="web" --keyword="http"

Found N libraries:

ArduinoJson
============
#ID: 64
An elegant and efficient JSON library for embedded systems

Keywords: web, json, http, rest
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 8266, Intel ARC32, Microchip
→PIC32, Nordic nRF51, Teensy, TI MSP430
Authors: Benoit Blanchon

ESPAsyncWebServer
=================
#ID: 306
Asynchronous HTTP and WebSocket Server Library for ESP8266 and ESP32

Keywords: async, websocket, http, webserver
Compatible frameworks: Arduino
Compatible platforms: Espressif 8266
Authors: Hristo Gochkov

ESP8266wifi
============
#ID: 1101
ESP8266 Arduino library with built in reconnect functionality

Keywords: web, http, wifi, server, client, wi-fi
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Jonas Ekstrand

Blynk
=====

(continues on next page)
Build a smartphone app for your project in minutes. Blynk allows creating IoT solutions easily. It supports WiFi, BLE, Bluetooth, Ethernet, GSM, USB, Serial. Works with many boards like ESP8266, ESP32, Arduino UNO, Nano, Due, Mega, Zero, MKR100, Yun,...

Keywords: control, gprs, protocol, communication, app, bluetooth, serial, cloud, web, usb, m2m, ble, 3G, smartphone, http, iot, device, sensors, data, esp8266, mobile, wifi, ethernet, gsm

Compatible frameworks: Arduino, Energia, WiringPi
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 8266, Intel ARC32, Linux ARM, Microchip PIC32, Nordic nRF51, Teensy, TI MSP430, TI Tiva
Authors: Volodymyr Shymanskyy

Show next libraries? [y/N]:

5. Search for libraries by “Adafruit Industries” author

> pio lib search --author="Adafruit Industries"

Found N libraries:

DHT sensor library
==================
#ID: 19
Arduino library for DHT11, DHT22, etc Temp & Humidity Sensors

Keywords: unified, dht, sensor, temperature, humidity
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Adafruit Industries

Adafruit DHT Unified
=====================
#ID: 18
Unified sensor library for DHT (DHT11, DHT22 and etc) temperature and humidity sensors

Keywords: unified, dht, sensor, temperature, humidity
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Adafruit Industries

Show next libraries? [y/N]:

6. Search for libraries which are compatible with Dallas temperature sensors like DS18B20, DS18S20 and etc.

> pio lib search "DS*"

Found N libraries:

DS1820
======
#ID: 196
Dallas / Maxim DS1820 1-Wire library. For communication with multiple DS1820 on a single 1-Wire bus. Also supports DS18S20 and DS18B20.
Keywords: ds18s20, 1-wire, ds1820, ds18b20
Compatible frameworks: mbed
Compatible platforms: Freescale Kinetis, Nordic nRF51, NXP LPC, ST STM32, Teensy
Authors: Michael Hagberg

I2Cdevlib-DS1307
=============
#ID: 99
The DS1307 serial real-time clock (RTC) is a low-power, full binary-coded decimal-
→(BCD) clock/calendar plus 56 bytes of NV SRAM

Keywords: i2cdevlib, clock, i2c, rtc, time
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Jeff Rowberg

Show next libraries? [y/N]: ...

7. Search for Energia-based *nRF24* or *HttpClient* libraries. The search query that is described below can be
interpreted like energia nRF24 OR energia HttpClient

> pio lib search "+(nRF24 HttpClient)" --framework="arduino"

Found N libraries:

RadioHead
=========
#ID: 124
The RadioHead Packet Radio library which provides a complete object-oriented library,
→for sending and receiving packetized messages via RF22/24/26/27/69, Si4460/4461/
→4463/4464, nRF24/nRF905, SX1276/77/78, RFM95/96/97/98 and etc.

Keywords: rf, radio, wireless
Compatible frameworks: Arduino, Energia
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 32, Espressif 8266, Infineon,
→XMC, Intel ARC32, Kendryte K210, Microchip PIC32, Nordic nRF51, Nordic nRF52, ST,
→STM32, ST STM8, Teensy, TI MSP430, TI Tiva
Authors: Mike McCauley

ArduinoHttpClient
=================
#ID: 798
[EXPERIMENTAL] Easily interact with web servers from Arduino, using HTTP and WebSocket
→'s.

Keywords: communication
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 32, Espressif 8266, Intel ARC32,
→Microchip PIC32, Nordic nRF51, Nordic nRF52, ST STM32, ST STM8, Teensy, TI MSP430
Authors: Arduino

HttpClient
==========
#ID: 66
(continues on next page)
Library to easily make HTTP GET, POST and PUT requests to a web server.

Keywords: communication
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 32, Espressif 8266, Intel ARC32, Microchip PIC32, Nordic nRF51, Nordic nRF52, ST STM32, Teensy, TI MSP430
Authors: Adrian McEwen

Show next libraries? [y/N]:
...

8. Search for the all sensor libraries excluding temperature.

> pio lib search "sensor -temperature"

Found N libraries:

SparkFun VL6180 Sensor
======================
#ID: 407
The VL6180 combines an IR emitter, a range sensor, and an ambient light sensor together for you to easily use and communicate with via an I2C interface.

Keywords: sensors
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR, Atmel SAM, Espressif 8266, Intel ARC32, Microchip PIC32, Nordic nRF51, Teensy, TI MSP430
Authors: Casey Kuhns@SparkFun, SparkFun Electronics

I2Cdevlib-AK8975
================
#ID: 10
AK8975 is 3-axis electronic compass IC with high sensitive Hall sensor technology

Keywords: i2c, i2cdevlib, sensor, compass
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Jeff Rowberg

Adafruit 9DOF Library
=====================
#ID: 14
Unified sensor driver for the Adafruit 9DOF Breakout (L3GD20 / LSM303)

Keywords: magnetometer, unified, accelerometer, spi, compass, i2c, sensor, gyroscope
Compatible frameworks: Arduino
Compatible platforms: Atmel AVR
Authors: Adafruit Industries

  - Options
  - Examples

**Usage**

```
pio lib [STORAGE_OPTIONS] uninstall [LIBRARY...]
```

# uninstall project dependent library  
# (run it from a project root where is located "platformio.ini")

(continues on next page)
pio lib uninstall [LIBRARY...]

# uninstall dependencies for the specific project environment
# (run it from a project root where is located "platformio.ini")
pio lib -e myenv uninstall [OPTIONS] [LIBRARY...]
pio lib -d /path/to/platformio/project -e myenv uninstall [OPTIONS] [LIBRARY...]

# uninstall library from global storage
pio lib --global uninstall [LIBRARY...]
pio lib -g uninstall [LIBRARY...]

# uninstall library from custom storage
pio lib --storage-dir /path/to/dir uninstall [LIBRARY...]
pio lib -d /path/to/dir uninstall [LIBRARY...]

# [LIBRARY...] forms
pio lib [STORAGE_OPTIONS] uninstall <id>
pio lib [STORAGE_OPTIONS] uninstall <id>@<version>
pio lib [STORAGE_OPTIONS] uninstall <id>@<version range>
pio lib [STORAGE_OPTIONS] uninstall <name>
pio lib [STORAGE_OPTIONS] uninstall <name>@<version>
pio lib [STORAGE_OPTIONS] uninstall <name>@<version range>

Description

Uninstall specified library

The version supports Semantic Versioning (<major>.<minor>.<patch>) and can take any of the following forms:

- 1.2.3 - an exact version number. Use only this exact version
- ^1.2.3 - any compatible version (exact version for 1.x.x versions)
- ~1.2.3 - any version with the same major and minor versions, and an equal or greater patch version
- >1.2.3 - any version greater than 1.2.3. >=, <, and <= are also possible
- >0.1.0, !=0.2.0, <0.3.0 - any version greater than 0.1.0, not equal to 0.2.0 and less than 0.3.0

Storage Options

See base options for Library Manager CLI.

Options

--save / --no-save

Remove libraries from the "platformio.ini" (Project Configuration File) dependency list (lib_deps) and save changes. Default value is to save.

-s, --silent

Suppress progress reporting.

-f, --force
Reinstall library if it is already installed.

**Examples**

```shell
> pio lib -g uninstall AsyncMqttClient
Library Storage: /storage/dir/...
Uninstalling AsyncMqttClient @ 0.2.0: [OK]
```

**pio lib update**

**Contents**

- **pio lib update**

# [LIBRARY...] forms
pio lib [STORAGE_OPTIONS] update <id>
pio lib [STORAGE_OPTIONS] update <id>@<version>
pio lib [STORAGE_OPTIONS] update <id>@<version range>
pio lib [STORAGE_OPTIONS] update <name>
pio lib [STORAGE_OPTIONS] update <name>@<version>
pio lib [STORAGE_OPTIONS] update <name>@<version range>
```
Description

Check or update installed libraries.

The version supports Semantic Versioning (<major>.<minor>.<patch>) and can take any of the following forms:

- 1.2.3 - an exact version number. Use only this exact version
- ^1.2.3 - any compatible version (exact version for 1.x.x versions)
- ~1.2.3 - any version with the same major and minor versions, and an equal or greater patch version
- >1.2.3 - any version greater than 1.2.3. >=, <, and <= are also possible
- >0.1.0, !=0.2.0, <0.3.0 - any version greater than 0.1.0, not equal to 0.2.0 and less than 0.3.0

Storage Options

See base options for Library Manager CLI.

Options

-c, --only-check
DEPRECATED. Please use --dry-run instead.

--dry-run
Do not update, only check for the new versions

--json-output
Return the output in JSON format

Examples

1. Update all installed libraries in global storage

```
> pio lib -g update
Library Storage: /storage/dir/...
Updating ESP8266_SSD1306 @ 3.2.3: [Up-to-date]
Updating EngduinoMagnetometer @ 3.1.0: [Up-to-date]
Updating IRremote @ 2.2.1: [Up-to-date]
Updating Json @ 5.4.0: [Out-of-date]
LibraryManager: Installing id=64 @ 5.6.4
Downloading [####################################] 100%
Unpacking [####################################] 100%
Json @ 5.6.4 has been successfully installed!
Updating PJON @ 1fb26fd: [Checking]
git version 2.7.4 (Apple Git-66)
Already up-to-date.
Updating TextLCD @ 308d188a2d3a: [Checking]
Mercurial Distributed SCM (version 3.8.4)
(see https://mercurial-scm.org for more information)
```
2. Update specified libraries in global storage

```shell
> pio lib -g update Json 4
Library Storage: /storage/dir/...
Updating Json @ 5.6.4: [Up-to-date]
Updating IRremote @ 2.2.1: [Up-to-date]
```

### pio org

New in version 5.0.

Manage organizations and their owners.

Management of teams and team memberships is done with the `pio team` command.

To print all available commands and options use:

```shell
pio org --help
pio org COMMAND --help
```

### pio org add

New in version 5.0.

#### Contents

- **pio org add**
  - **Usage**
  - **Description**
  - **Examples**
  - **See Also**

#### Usage

```shell
pio org add ORGNAME USERNAME
```

#### Description

Add a user as an owner to an organization.
If you need to create a new organization, please use `pio org create` command.

**Examples**

Add Bob as an owner of “platformio” organization:

```bash
> pio org add platformio bob
The new owner "bob" has been successfully added to the "platformio" organization.
```

**See Also**

- `pio org create`
- `pio org list`
- `pio org remove`

**pio org create**

New in version 5.0.

**Contents**

- `pio org create`
  - Usage
  - Description
    * Options
  - Examples
  - See Also

**Usage**

```bash
pio org create [OPTIONS] ORGNAME
```

**Description**

Create a new organization.

**Options**

--email
An organization e-mail.

--displayname
An organization display name (company name).

**Examples**

```bash
> pio org create platformio --email contact@platformio.org --displayname PlatformIO
The organization "platformio" has been successfully created.
```

**See Also**

- `pio org list`
- `pio org remove`

**pio org destroy**

New in version 5.0.

**Contents**

- `pio org destroy`
  - Usage
  - Description
  - See Also

**Usage**

`pio org destroy ORGNAME`

**Description**

Destroy an organization and its teams.

If you need to remove a user from an organization, please use `pio org remove` command.

**See Also**

- `pio org create`
- `pio org list`
- `pio org update`
pio org list

New in version 5.0.

Contents

- pio org list
  - Usage
  - Description
  - Options
  - Examples

Usage

```
pio org list [OPTIONS] [OWNER]
```

Description

List organizations and their owners.

Options

```
--json-output
```

Return the output in JSON format

Examples

```
> pio org list
...
platformio
--------
Display Name: PlatformIO
Owners: alice, bob
...
```

pio org remove

New in version 5.0.
Usage

`pio org remove ORGNAME USERNAME`

Description

Remove a user from an organization.

If you need to destroy an existing organization, please use `pio org destroy` command.

Examples

Remove Bob from “platformio” organization:

```
> pio org remove platformio bob
The `bob` owner has been successfully removed from the `platformio` organization.
```

See Also

- `pio org add`
- `pio org list`

pio org update

New in version 5.0.
Usage

```
pio org update [OPTIONS] ORGNAME
```

Description

Rename the organization or update the existing details.

Options

```
--orgname
```
New organization “orgname”. Must contain only alphanumeric characters or single hyphens, cannot begin or end with a hyphen, and must not be longer than 38 characters.

```
--email
```
An organization e-mail.

```
--displayname
```
An organization name (company name).

Examples

```
> pio org update platformio --email contact@platformio.org --displayname PlatformIO
The organization "platformio" has been successfully updated.
```

See Also

- `pio org list`
- `pio org remove`

pio package

Manage packages in the registry.

To print all available commands and options use:

```
pio package --help
pio package COMMAND --help
```

pio package pack

New in version 5.0.
Contents

- pio package pack
  - Usage
  - Description
    - Options
  - See Also

Usage

pio package pack [<source directory, tar.gz or zip>] [OPTIONS]

Description

Create a tarball from a package (library, Development Platforms, or tool).
If no arguments are supplied, then platformio packs the current package folder.
A source of a package must contain a manifest (should be located in a root of a package) depending on a package type:

Library A library.json is a manifest file of a library package.

Platform A platform.json is a manifest file of a development platform package. See Manifest File platform.json.

Tool A package.json is a manifest file of a tool package. It is intended for toolchains, flashers, debugging servers, simulators, and other tools.

See a manifest validation scheme.

Options

-o, --output

Specify a destination path (folder or a full path to file) where to store a tarball. The default is to create a tarball in the current working directory.

See Also

- library.json
- pio package publish

pio package publish

New in version 5.0.
Usage

```shell
pio package publish [<source directory, tar.gz or zip>] [OPTIONS]
```

Description

Publish a package to the registry so that it can be installed by name. All files in the package directory are included if `export` field is not declared in a package manifest (for example, see `export`). The next items are automatically excluded.

Please check which files will be included in the final package using the `pio package pack` command.

Once a package is published with a given name and version, that specific name and version combination can never be used again, even if it is removed with the `pio package unpublish` command.

If no arguments are supplied, then PlatformIO packs the current package folder.

To list published packages, please use `pio access list` command.

Options

```
--owner
PlatformIO Account username (can be organization username). The default is set to a username of the authorized PlatformIO Account.

--released-at
Custom release date and time in the next format (UTC): 2014-06-13 17:08:52

--private
```

Note: The permission to set custom release dates and times is only available to Super Admins.

Restrict access to a package (will not be available publicly). The default is to publish a package publicly.

```
--no-notify
```

Do not notify by email when package is processed. The default behavior is to notify.
See Also

- `library.json`
- `pio package pack`
- `pio package unpublish`

**pio package unpublish**

New in version 5.0.

### Contents

- `pio package unpublish`
  - **Usage**
  - **Description**
    - * Options
  - **See Also**

### Usage

```sh
pio package unpublish [<organization>/]<pkgname>[@<version>] [OPTIONS]
```

### Description

This removes a package version from the registry, deleting its entry and removing the tarball.

If no version is specified, or if all versions are removed then the root package entry is removed from the registry entirely.

You can only remove a package version within 72 hours since the published date.

### Options

---`type`

Set the type of a package to unpublish (if you have packages with the same name). Possible values are `library`, `platform`, or `tool`. The default is set to `library`.

---`undo`

Undo a remove, putting a version back into the registry.

### See Also

- `library.json`
- `pio package pack`
• *pio package publish*

**Platform Manager CLI**

To print all available commands and options use:

```
pio platform --help
pio platform COMMAND --help
```

**pio platform frameworks**

**Contents**

- *pio platform frameworks*
  - Usage
  - Description
  - Options
  - Examples

**Usage**

```
pio platform frameworks QUERY [OPTIONS]
```

**Description**

List supported *Frameworks* (SDKs, etc).

**Options**

--json-output

Return the output in *JSON* format

**Examples**

Print all supported frameworks, SDKs, etc.

```
> pio platform frameworks
arduino ~ Arduino
===============
Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences.
```

(continues on next page)
artik-sdk ~ ARTIK SDK
======================

ARTIK SDK is a C/C++ SDK targeting Samsung ARTIK platforms. It exposes a set of APIs to ease up development of applications. These APIs cover hardware buses such as GPIO, SPI, I2C, UART, connectivity links like Wi-Fi, Bluetooth, Zigbee, and network protocols such as HTTP, Websockets, MQTT, and others.

Home: https://platformio.org/frameworks/artik-sdk

cmsis ~ CMSIS
-------------

The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software re-use, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices.

Home: https://platformio.org/frameworks/cmsis

espidf ~ ESP-IDF
===============

Home: https://platformio.org/frameworks/espidf

libopencm3 ~ libOpenCM3
=======================

The libOpenCM3 framework aims to create a free/libre/open-source firmware library for various ARM Cortex-M0+/M3/M4 microcontrollers, including ST STM32, Ti Tiva and Stellaris, NXP LPC 11xx, 13xx, 15xx, 17xx parts, Atmel SAM3, Energy Micro EFM32 and others.

Home: https://platformio.org/frameworks/libopencm3

mbed ~ mbed
-----------

The mbed framework The mbed SDK has been designed to provide enough hardware abstraction to be intuitive and concise, yet powerful enough to build complex projects. It is built on the low-level ARM CMSIS APIs, allowing you to code down to the metal if needed. In addition to RTOS, USB and Networking libraries, a cookbook of hundreds of reusable peripheral and module libraries have been built on top of the SDK by the mbed Developer Community.

Home: https://platformio.org/frameworks/mbed

pumbaa ~ Pumbaa
-------------

Pumbaa is Python on top of Simba. The implementation is a port of MicroPython, designed for embedded devices with limited amount of RAM and code memory.

Home: https://platformio.org/frameworks/pumbaa

simba ~ Simba
--------------

(continues on next page)
Simba is an RTOS and build framework. It aims to make embedded programming easy and portable.

Home: https://platformio.org/frameworks/simba

spl ~ SPL

The ST Standard Peripheral Library provides a set of functions for handling the peripherals on the STM32 Cortex-M3 family. The idea is to save the user (the new user, in particular) having to deal directly with the registers.

Home: https://platformio.org/frameworks/spl

wiringpi ~ WiringPi

WiringPi is a GPIO access library written in C for the BCM2835 used in the Raspberry Pi. It's designed to be familiar to people who have used the Arduino "wiring" system.

Home: https://platformio.org/frameworks/wiringpi

pio platform install

Contents

- pio platform install
  - Usage
  - Options
  - Description
  - Version control
    - Git
    - Mercurial
    - Subversion
  - Examples

Usage

pio platform install [OPTIONS] [PLATFORM...]

# [PLATFORM...] forms
pio platform install <name>
pio platform install <name>@<version>
pio platform install <name>@<version range>
pio platform install <ownername>@<version>
pio platform install <ownername>@<version range>

(continues on next page)
pio platform install <zip or tarball url>
pio platform install file://<zip or tarball file>
pio platform install file://<folder>
pio platform install <repository>
pio platform install <name=repository> (name it should have locally)
pio platform install <repository#tag> ("tag" can be commit, branch or tag)

Options

--with-package
Install specified package (or alias)
--without-package
Do not install specified package (or alias)
--skip-default
Skip default packages
--with-all-packages
Install all declared packages in platform.json
-f, --force
Reinstall/redownload development platform and its packages if they exist

Description

Install Development Platforms and dependent packages.
The version supports Semantic Versioning (<major>.<minor>.<patch>) and can take any of the following forms:

- ^1.2.3 - any compatible version (new functionality in a backwards compatible manner and patches are allowed, 1.x.x). **RECOMMENDED**
- ~1.2.3 - any version with the same major and minor versions, and an equal or greater patch version
- >1.2.3 - any version greater than 1.2.3. >=, <, and <= are also possible
- >0.1.0, !=0.2.0, <0.3.0 - any version greater than 0.1.0, not equal to 0.2.0 and less than 0.3.0
- 1.2.3 - an exact version number. Use only this exact version.

Also, PlatformIO supports installing from local directory or archive. Need to use file:// prefix before local path. Also, directory or archive should contain platform.json manifest.

- file:///local/path/to/the/platform/dir
- file:///local/path/to/the/platform.zip
- file:///local/path/to/the/platform.tar.gz
Version control

PlatformIO supports installing from Git, Mercurial and Subversion, and detects the type of VCS using url prefixes: “git+”, “hg+”, or “svn+”.

**Note:** PlatformIO requires a working VCS command on your path: `git`, `hg` or `svn`.

**Git**

The supported schemes are: `git`, `git+https` and `git+ssh`. Here are the supported forms:

- `https://github.com/platformio/platform-NAME.git`
- `git+git://git.server.org/my-platform`
- `git+https://git.server.org/my-platform`
- `git+ssh://git.server.org/my-platform`
- `git+ssh://user@git.server.org/my-platform`
- `[user@]host.xz:path/to/repo.git`

Passing branch names, a commit hash or a tag name is possible like so:

- `https://github.com/platformio/platform-name.git#master`
- `git+git://git.server.org/my-platform#master`
- `git+https://git.server.org/my-platform#v1.0`
- `git+ssh://git.server.org/my-platform#7846d8ad52f983f2f2887bdc0f073fe9755a806d`

**Mercurial**

The supported schemes are: `hg+http`, `hg+https` and `hg+ssh`. Here are the supported forms:

- `hg+http://hg.server.org/my-platform`
- `hg+https://hg.server.org/my-platform`
- `hg+ssh://hg.server.org/my-platform`

Passing branch names, a commit hash or a tag name is possible like so:

- `hg+http://hg.server.org/my-platform#master`
- `hg+https://hg.server.org/my-platform#v1.0`
- `hg+ssh://hg.server.org/my-platform#4cfe2fa00668`

**Subversion**

The supported schemes are: `svn`, `svn+svn`, `svn+http`, `svn+https` and `svn+ssh`. Here are the supported forms:

- `svn+svn://svn.server.org/my-platform`
- `svn+https://svn.server.org/my-platform`
Examples

1. Install Atmel AVR with default packages

```
> pio platform install atmelavr

PlatformManager: Installing atmelavr
Downloading...
Unpacking [####################################] 100%
atmelavr @ 0.0.0 has been successfully installed!
PackageManager: Installing tool-scons @ >=2.3.0,<2.6.0

> pio platform search texas

timsp430 ~ TI MSP430

MSP430 microcontrollers (MCUs) from Texas Instruments (TI) are 16-bit, RISC-based, mixed-signal processors designed for ultra-low power. These MCUs offer the lowest power consumption and the perfect mix of integrated peripherals for thousands of applications.

Home: https://platformio.org/platforms/timsp430

Packages: toolchain-timsp430, tool-mspdebug, framework-energiamsp430, framework-arduinomsp430

titiva ~ TI TIVA

Texas Instruments TM4C12x MCUs offer the industrys most popular ARM Cortex-M4 core with scalable memory and package options, unparalleled connectivity peripherals, advanced application functions, industry-leading analog integration, and extensive software solutions.

Home: https://platformio.org/platforms/titiva

Packages: ldscripts, framework-libopencm3, toolchain-gccarmnoneeabi, tool-lm4flash, framework-energiativa

> pio platform search framework-mbed

atmelsam ~ Atmel SAM

Atmel | SMART offers Flash-based ARM products based on the ARM Cortex-M0+, Cortex-M3 and Cortex-M4 architectures, ranging from 8KB to 2MB of Flash including a rich peripheral and feature mix.

Home: https://platformio.org/platforms/atmelsam

(continues on next page)
Packages: toolchain-gccarmnoneeabi, framework-arduinosam, framework-simba, tool-
→openocd, framework-mbed, ldscripts, tool-bossac

freescalekinetis ~ Freescale Kinetics
====================================
Freescale Kinetics Microcontrollers is family of multiple hardware- and software-
→compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetics MCUs,
→offer exceptional low-power performance, scalability and feature integration.

Home: https://platformio.org/platforms/freescalekinetis
Packages: framework-mbed, toolchain-gccarmnoneeabi

nordicnrf51 ~ Nordic nRF51
==========================
The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-
→chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices,
→support a range of protocol stacks including Bluetooth Smart (previously called,
→Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.

Home: https://platformio.org/platforms/nordicnrf51
Packages: framework-mbed, tool-rfdloader, toolchain-gccarmnoneeabi, framework-
→arduinonordicnrf51

nxplpc ~ NXP LPC
==============
The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP.
→Semiconductors. The LPC chips are grouped into related series that are based around
→the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+
→or Cortex-M0. Internally, each microcontroller consists of the processor core,
→static RAM memory, flash memory, debugging interface, and various peripherals.

Home: https://platformio.org/platforms/nxplpc
Packages: framework-mbed, toolchain-gccarmnoneeabi

siliconlabsefm32 ~ Silicon Labs EFM32
=====================================
Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that,
→offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to
→48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features,
→innovative low energy techniques, short wake-up time from energy saving modes and a
→wide selection of peripherals, making it ideal for battery operated applications,
→and other systems requiring high performance and low-energy consumption.

Home: https://platformio.org/platforms/siliconlabsefm32
Packages: framework-mbed, toolchain-gccarmnoneeabi

ststm32 ~ ST STM32
==============
The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed,
→to offer new degrees of freedom to MCU users. It offers a 32-bit product range that,
→combines very high performance, real-time capabilities, digital signal processing,
→and low-power, low-voltage operation, while maintaining full integration and ease
→of development.

Home: https://platformio.org/platforms/ststm32
Packages: framework-libopencm3, toolchain-gccarmnoneeabi, tool-stlink, framework-spl,
→framework-cmsis, framework-mbed, ldscripts

(continues on next page)
teensy ~ Teensy
===============
Teensy is a complete USB-based microcontroller development system, in a very small footprint, capable of implementing many types of projects. All programming is done via the USB port. No special programmer is needed, only a standard USB cable and a PC or Macintosh with a USB port.

Home: https://platformio.org/platforms/teensy
Packages: framework-arduinoteensy, tool-teensy, toolchain-gccarmnoneeabi, framework-mbed, toolchain-atmelavr, ldscripts

> pio platform show atmelavr

atmelavr ~ Atmel AVR
======================
Atmel AVR 8- and 32-bit MCUs deliver a unique combination of performance, power efficiency and design flexibility. Optimized to speed time to market and easily adapt to new ones—they are based on the industry’s most code-efficient architecture for C and assembly programming.

Version: 1.2.1
Home: https://platformio.org/platforms/atmelavr
License: Apache-2.0
Frameworks: simba, arduino

(continues on next page)
Package toolchain-atmelavr
--------------------------
Type: toolchain
Requirements: ~1.40902.0
Installed: Yes
Description: avr-gcc
Version: 1.40902.0 (4.9.2)

Package framework-arduinoavr
-----------------------------
Type: framework
Requirements: ~1.10612.1
Installed: Yes
Url: https://www.arduino.cc/en/Main/Software
Version: 1.10612.1 (1.6.12)
Description: Arduino Wiring-based Framework (AVR Core, 1.6)

Package framework-simba
------------------------
Type: framework
Requirements: >=7.0.0
Installed: Yes
Url: https://github.com/eerimoq/simba
Version: 11.0.0
Description: Simba Embedded Programming Platform

Package tool-avrdude
---------------------
Type: uploader
Requirements: ~1.60300.0
Installed: Yes
Description: AVRDUDE
Url: http://www.nongnu.org/avrdude/
Version: 1.60300.0 (6.3.0)

Package tool-micronucleus
-------------------------
Type: uploader
Requirements: ~1.200.0
Installed: No (optional)

pio platform uninstall

  - Examples

Usage

```
pio platform update [OPTIONS] [PLATFORM...]

# update specific platform version using Semantic Versioning
pio platform update PLATFORM@X.Y.Z
```

Description

Check or update installed Development Platforms

Options

- `p`, `--only-packages`
Update only the platform related packages. Do not update development platform build scripts, board configs and etc.

`-c, --only-check`

DEPRECATED. Please use `--dry-run` instead.

`--dry-run`

Do not update, only check for the new versions

`--json-output`

Return the output in JSON format

**Examples**

```
> pio platform update

Platform atmelavr
--------
Updating atmelavr @ 0.0.0: [Up-to-date]
Updating framework-arduinavr @ 1.10608.1: [Up-to-date]
Updating tool-avrdude @ 1.60001.1: [Up-to-date]
Updating toolchain-atmelavr @ 1.40801.0: [Up-to-date]
Updating tool-scons @ 2.4.1: [Up-to-date]

Platform espressif8266
--------
Updating espresif @ 0.0.0: [Up-to-date]
Updating tool-scons @ 2.4.1: [Up-to-date]
Updating toolchain-xtensa @ 1.40802.0: [Up-to-date]
Updating tool-esptool @ 1.409.0: [Up-to-date]
Updating tool-mkspiffs @ 1.102.0: [Up-to-date]
Updating framework-arduinoespressif8266 @ 1.20300.0: [Up-to-date]
Updating sdk-esp8266 @ 1.10502.0: [Up-to-date]

Platform teensy
--------
Updating teensy @ 0.0.0: [Up-to-date]
Updating framework-arduinoteensy @ 1.128.0: [Up-to-date]
Updating tool-teensy @ 1.1.0: [Up-to-date]
Updating framework-mbed @ 1.121.0: [Up-to-date]
Updating tool-scons @ 2.4.1: [Up-to-date]

```
pio project --help
pio project COMMAND --help
```
pio project config

Contents

• pio project config
  – Usage
  – Description
    • Options
  – Examples

Usage

pio project config [OPTIONS]

Description

Show project computed configuration based on “platformio.ini” (Project Configuration File). The extra configuration files and dynamic variables will be expanded.

This command is useful for developers to check how PlatformIO computes configuration from “platformio.ini” (Project Configuration File).

Options

-d, --project-dir

Specify the path to project directory. By default, --project-dir is equal to current working directory (CWD).

--json-output

Return the output in JSON format.

Examples

> pio project config
Computed project configuration for Tasmota Project

platformio
---------
src_dir = tasmota
build_dir = .pioenvs
build_cache_dir = .cache
extra_configs = platformio_tasmota_env.ini
                  platformio_override.ini
default_envs = tasmota

### pio project data

New in version 5.0.

#### Contents

- pio project data
  - Usage
  - Description
  - Options

#### Usage

```
pio project data [OPTIONS]
```
Description

Dump data intended for IDE extensions/plugins:

- Toolchain type and location
- Compiler flags
- Defines/Macros
- CPP Preprocessor includes/paths
- Program path
- SVD path if available for Development Platforms
- Targets by Development Platforms (see `pio run --list-targets` for details)
- Extra information.

Options

-d, --project-dir
Specify the path to project directory. By default, `--project-dir` is equal to current working directory (CWD).

-e, --environment
Dump specified environments. Multiple environments are allowed.

--json-output
Return the output in JSON format.

pio project init

Usage

```
pio project init [OPTIONS]
```
Description

Initialize a new PlatformIO based project or update existing with new data.

This command will create:

- "platformio.ini" (Project Configuration File)
- \texttt{include\_dir}, put project header files here
- \texttt{src\_dir}, put project source files here (*.h, *.c, *.cpp, *.S, *.ino, etc.)
- \texttt{lib\_dir}, put project specific (private) libraries here. See also \textit{Library Dependency Finder (LDF)}
- \texttt{test\_dir}, put project tests here. More details \textit{Unit Testing}
- Miscellaneous files for VCS and \textit{Continuous Integration} support.

Options

- \texttt{-d, --project-dir}
  A path to a directory where \texttt{PlatformIO} will initialize new project.

- \texttt{-b, --board}
  If you specify board ID (you can pass multiple \texttt{-b} options), then \texttt{PlatformIO} will automatically generate environment for "platformio.ini" (Project Configuration File) and pre-fill these data:
  - platform
  - framework
  - board
  The full list with pre-configured boards is available here \textit{Development Platforms}.

- \texttt{--ide}
  Initialize PlatformIO project for the specified IDE which can be imported later via "Import Project" functionality.
  A list with supported IDE is available within \texttt{pio project init --help} command. Also, please take a look at \textit{Cloud & Desktop IDE} page.

- \texttt{-e, --environment}
  New in version 5.0.
  Update project using existing environment.

- \texttt{-O, --project-option}
  Initialize project with additional options from "platformio.ini" (Project Configuration File). For example, \texttt{pio project init --project-option="lib\_deps=ArduinoJSON"}. Multiple options are allowed.

- \texttt{--env-prefix}
  An environment prefix which will be used with pair in board ID. For example, the default environment name for Teensy 3.1/3.2 board will be [env:teensy31].

- \texttt{-s, --silent}
  Suppress progress reporting
Examples

1. Initialize new project in a current working directory

```bash
> pio project init
```

The current working directory *** will be used for the new project. You can specify another project directory via `pio project init -d %PATH_TO_THE_PROJECT_DIR%` command.

The next files/directories will be created in ***
- platformio.ini - Project Configuration File. |-> PLEASE EDIT ME <-|
- src - Put your source files here
- lib - Put here project specific (private) libraries

Project has been successfully initialized!

Useful commands:
- `pio run` - process/build project from the current directory
- `pio run --target upload` or `pio run -t upload` - upload firmware to embedded board
- `pio run --target clean` - clean project (remove compiled files)

2. Initialize new project in a specified directory

```bash
> pio project init -d %PATH_TO_DIR%
```

The next files/directories will be created in ***
- platformio.ini - Project Configuration File. |-> PLEASE EDIT ME <-|

3. Initialize project for Arduino Uno

```bash
> pio project init --board uno
```

4. Initialize project for Teensy 3.1 board with custom Mbed

```bash
> pio project init --board teensy31 --project-option "framework=mbed"
```

5. Initialize a new project passing working environment name and its options

```bash
> pio project init --environment native --project-option="platform=native" --project-option="build_flags=-DRELEASE=1"
```

The current working directory *** will be used for the new project.
PlatformIO Remote CLI

Helper command for Remote Development.

To print all available commands and options use:

```
pio remote --help
pio remote COMMAND --help

# run command on the specified PlatformIO Remote Agents
pio remote --agent NAME_1 --agent NAME_N COMMAND
```

PlatformIO Remote Agent

Start PlatformIO Remote Agent on a host machine and work remotely with your devices WITHOUT extra software, services, SSH, VPN, tunneling or opening incoming network ports.

Remote Development supports wired and wireless devices. Wired devices should be connected physically to host machine where PlatformIO Remote Agent is started, where wireless devices should be visible for PlatformIO Remote Agent to provide network operations Over-The-Air (OTA).

Contents

- PlatformIO Remote Agent
  - pio remote agent list
    - Usage
    - Description
    - Example
  - pio remote agent start
    - Usage
    - Description
    - Options

pio remote agent list

Usage

```
pio remote agent list
```

Description

List active PlatformIO Remote Agent s started using own PlatformIO Account or shared with you by other PlatformIO developers.
Example

```bash
> pio remote agent list

innomac.local
-------------
ID: 98853d930....788d77375e7
Started: 2016-10-26 16:32:56
```

`pio remote agent start`

Usage

`pio remote agent start [OPTIONS]`

Description

Start *PlatformIO Remote Agent* and work remotely with your devices from anywhere in the world. This command can be run as daemon or added to autostart list of your OS.

Options

`-n, --name`
Agent name/alias. By default, machine’s `hostname` will be used. You can use this name later for `pio remote device` and `pio remote run` commands. Good names are home, office, lab or etc.

`-s, --share`
Share your agent/devices with other PlatformIO developers who have *PlatformIO Account*: friends, co-workers, team, etc.

The valid value for `--share` option is email address that was used for `pio account register` command.

`-d, --working-dir`
A working directory where *PlatformIO Remote Agent* stores projects data for incremental synchronization and embedded programs for PlatformIO Process Supervisor.

`pio remote device`

Remote Device: monitor remote device or list existing.

Contents

- `pio remote device`
  - `pio remote device list`
pio remote device list

Usage

pio remote device list [OPTIONS]

# List devices from the specified agents. Multiple agents are allowed.
pio remote --agent NAME device list [OPTIONS]

Description

List Serial Ports on remote machines where PlatformIO Remote Agent is started.

You can list devices from the specified remote machines using --agent NAME option between “remote” & “device” sub-commands. For example, you have run pio remote agent start --name option with “home” and “office” options:

• pio remote agent start --name home
• pio remote agent start --name office

Now, to list devices from office machine please use pio remote --agent office device list.

Multiple agents are allowed (pio remote --agent lab1 --agent lab3 device ...).

Options

--json-output
Return the output in JSON format

Example

> pio remote device list
Agent innomac.local

(continues on next page)
pio remote device monitor

Remote Serial Port Monitor

Usage

```bash
pio remote device monitor [OPTIONS]
```

# Connect to a specified agent
```bash
pio remote --agent NAME device monitor [OPTIONS]
pio remote -a NAME device monitor [OPTIONS]
```

Description

Connect to Serial Port of remote device and receive or send data in real time. *PlatformIO Remote Agent* should be started before on a remote machine.

To control *monitor* please use these “hot keys”:

- Ctrl+C Quit
- Ctrl+T Menu
- Ctrl+T followed by Ctrl+H Help
Options

-p, --port
Port, a number or a device name

-b, --baud
Set baud rate, default 9600

--parity
Set parity (None, Even, Odd, Space, Mark), one of [N, E, O, S, M], default N

--rtscts
Enable RTS/CTS flow control, default Off

--xonxoff
Enable software flow control, default Off

--rts
Set initial RTS line state, default 0

--dtr
Set initial DTR line state, default 0

--echo
Enable local echo, default Off

--encoding
Set the encoding for the serial port (e.g. hexlify, Latin1, UTF-8), default UTF-8.

-f, --filter
Add text transformation. Available filters:
  • colorize Apply different colors for received and echo
  • debug Print what is sent and received
  • default Remove typical terminal control codes from input
  • direct Do-nothing: forward all data unchanged
  • nocontrol Remove all control codes, incl. CR+LF
  • printable Show decimal code for all non-ASCII characters and replace most control codes

--eol
End of line mode (CR, LF or CRLF), default CRLF

--raw
Do not apply any encodings/transformation

--exit-char
ASCII code of special character that is used to exit the application, default 3 (DEC, Ctrl+C).
For example, to use Ctrl+] run pio remote device monitor --exit-char 29.

--menu-char
ASCII code of special character that is used to control miniterm (menu), default 20 (DEC)
---quiet
Diagnostics: suppress non-error messages, default Off

-d, --project-dir
Specify the path to project directory. By default, --project-dir is equal to current working directory (CWD).

-e, --environment
Process specified environments.

You can also specify which environments should be processed by default using default_envs option from “platformio.ini” (Project Configuration File).

Examples

1. Show available options for monitor

> pio remote device monitor --help

Usage: pio remote device monitor [OPTIONS]

Options:
-p, --port TEXT  Port, a number or a device name
-b, --baud INTEGER  Set baud rate, default=9600
--parity [N|E|O|S|M]  Set parity, default=N
--rtscts  Enable RTS/CTS flow control, default=Off
--xonxoff  Enable software flow control, default=Off
--rts [0|1]  Set initial RTS line state, default=0
--dtr [0|1]  Set initial DTR line state, default=0
--echo  Enable local echo, default=Off
--encoding TEXT  Set the encoding for the serial port (e.g. hexlify, Latin1, UTF-8), default: UTF-8
-f, --filter TEXT  Add text transformation
--eol [CR|LF|CRLF]  End of line mode, default=CRLF
--raw  Do not apply any encodings/transformations
--exit-char INTEGER  ASCII code of special character that is used to exit the application, default=29 (DEC)
--menu-char INTEGER  ASCII code of special character that is used to control miniterm (menu), default=20 (DEC)
--quiet  Diagnostics: suppress non-error messages, default=Off
-h, --help  Show this message and exit.

2. Communicate with serial device and print help inside terminal

> pio remote device monitor

--- Available ports:
--- /dev/cu.Bluetooth-Incoming-Port n/a
--- /dev/cu.Bluetooth-Modem n/a
--- /dev/cu.SLAB_USBtoUART CP2102 USB to UART Bridge Controller
--- /dev/obd2ecu-SPPDev n/a
Enter port name:/dev/cu.SLAB_USBtoUART
--- Miniterm on /dev/cu.SLAB_USBtoUART: 9600,8,N,1 ---
--- Quit: Ctrl+C | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
Hello PlatformIO!
---
--- Ctrl+] Exit program

(continues on next page)
pio remote run

Remote Firmware Updates

Contents

• pio remote run
  – Usage
  – Description
  – Options
  – Example

Usage

pio remote run [OPTIONS]

# process environments using specified PlatformIO Remote Agent
pio remote --agent NAME run [OPTIONS]

Description

Process remotely environments which are defined in “platformio.ini” (Project Configuration File) file. By default, Remote Development builds project on a host machine and deploy final firmware (program) to a remote device (embedded board).
If you need to process project on a remote machine, please use `pio remote run --force-remote` option. In this case, `Remote Development` will automatically synchronize your project with remote machine, install required toolchains, frameworks, SDKs, etc., and process project.

**Options**

- **-e, --environment**
  Process specified environments.
  You can also specify which environments should be processed by default using `default_envs` option from “`platformio.ini`” *(Project Configuration File)*.

- **-t, --target**
  Process specified targets. See `pio run --list-targets` documentation for available targets.

- **--upload-port**
  Custom upload port of embedded board. To print all available ports use `pio remote device` command.
  If upload port is not specified, PlatformIO will try to detect it automatically.

- **-d, --project-dir**
  Specify the path to project directory. By default, `--project-dir` is equal to current working directory *(CWD)*.

- **-v, --verbose**
  Shows detailed information when processing environments.
  This option can also be set globally using `force_verbose` setting or by environment variable `PLATFORMIO_SETTING_FORCE_VERBOSE`.

- **--disable-auto-clean**
  Disable auto-clean of `build_dir` when “`platformio.ini`” *(Project Configuration File)* or `src_dir` (project structure) have been modified.

- **-r, --force-remote**
  By default, `Remote Development` builds project on a host machine and deploy final firmware (program) to remote device (embedded board).
  If you need to process project on remote machine, please use `pio remote run --force-remote` option. In this case, `Remote Development` will automatically synchronize your project with remote machine, install required toolchains, frameworks, SDKs, etc., and process project.

**Example**

```
> pio remote run --environment uno --target upload

Building project locally
[Wed Oct 26 16:35:09 2016] Processing uno (platform: atmelavr, board: uno, framework: ...
  --arduino)
-------------------------------------------------------------------------------
Verbose mode can be enabled via `-v, --verbose` option
Collected 25 compatible libraries
Looking for dependencies...
Project does not have dependencies

• pio remote test
  – Usage
  – Description
  – Options
  – Examples

Usage

pio remote test [OPTIONS]

# run tests on specified PlatformIO Remote Agent
pio remote --agent NAME test [OPTIONS]

Description

Run remotely tests from PlatformIO based project. More details about PlatformIO Unit Testing.

This command allows you to apply the tests for the environments specified in "platformio.ini" (Project Configuration File).

Options

-e, --environment
Process specified environments. More details `pio run --environment`

--ignore

Ignore tests where the name matches specified patterns. More than one pattern is allowed. If you need to ignore some tests for the specific environment, please take a look at `test_ignore` option from “platformio.ini” (Project Configuration File).

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td>[seq]</td>
<td>matches any character in seq</td>
</tr>
<tr>
<td>![seq]</td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

For example, `pio remote test --ignore "mytest*" -i "test[13]"

--upload-port

A port that is intended for firmware uploading. To list available ports please use `pio device list` command.

If upload port is not specified, PlatformIO will try to detect it automatically.

--test-port

A Serial/UART port that PlatformIO uses as communication interface between PlatformIO Unit Test Engine and target device. To list available ports please use `pio device list` command.

If test port is not specified, PlatformIO will try to detect it automatically.

-d, --project-dir

Specify the path to project directory. By default, `--project-dir` is equal to current working directory (CWD).

-r, --force-remote

By default, `Remote Development` processes project on a host machine and deploy final testing firmware (program) to remote device (embedded board).

If you need to process project on remote machine, please use `pio remote test --force-remote` option. In this case, `Remote Development` will automatically synchronize your project with remote machine, install required toolchains, frameworks, SDKs, etc., and process project.

--without-building

Skip building stage.

--without-uploading

Skip uploading stage

-v, --verbose

Shows detailed information when processing environments.

This option can also be set globally using `force_verbose` setting or by environment variable `PLATFORMIO_SETTING_FORCE_VERBOSE`.

Examples

For the examples please follow to `Unit Testing` page.
pio remote update

Usage

```bash
pio remote update [OPTIONS]
```

# start update process on the specified agents/machines
```bash
pio remote --agent NAME update [OPTIONS]
```

Description

Check or update installed Development Platforms and global Libraries on the remote machine.

Options

- `-c`, `--only-check`
  DEPRECATED. Please use `--dry-run` instead.

- `--dry-run`
  Do not update, only check for the new versions

Examples

```bash
> pio remote update

pio run

Contents

• pio run
  – Usage
  – Description
  – Options
  – Examples

Usage

pio run [OPTIONS]

Description

Run project targets over environments declared in “platformio.ini” (Project Configuration File).

Options

-e, --environment
Process specified environments. Multiple environments are allowed.
You can also specify which environments should be processed by default using default_envs option from “platformio.ini” (Project Configuration File).

-t, --target
Process specified targets. Multiple targets are allowed.
You can configure default targets per project environment using targets option in “platformio.ini” (Project Configuration File).

--list-targets
New in version 5.0.
List available project targets. It’s also possible to list targets per project environment using pio run --environment option.
There are also built-in system targets:

  • Device
    – monitor automatically start pio device monitor after successful build operation. You can configure monitor using Monitor options.
  • System
    – envdump dump current build environment

--upload-port
Custom upload port of embedded board. To print all available ports use `pio device list` command.

If upload port is not specified, PlatformIO will try to detect it automatically.

`-d, --project-dir`
Specify the path to project directory. By default, `--project-dir` is equal to current working directory (CWD).

`-c, --project-conf`
Process project with a custom "platformio.ini" (Project Configuration File).

`-j, --jobs`
Control a number of parallel build jobs. Default is a number of CPUs in a system.

`-s, --silent`
Suppress progress reporting

`-v, --verbose`
Shows detailed information when processing environments.

This option can also be set globally using `force_verbose` setting or by environment variable `PLATFORMIO_SETTING_FORCE_VERBOSE`.

`--disable-auto-clean`
Disable auto-clean of `build_dir` when "platformio.ini" (Project Configuration File) or `src_dir` (project structure) have been modified.

Examples

1. Process Wiring Blink Example

```shell
> pio run

```

(continues on next page)
Program: 1034 bytes (3.2% Full) (.text + .data + .bootloader)

Data: 9 bytes (0.4% Full) (.data + .bss + .noinit)

pio settings

Manage PlatformIO settings

Contents

- pio settings
  - pio settings get
    * Usage
    * Description
**Settings**

- `auto_update_libraries`
- `auto_update_platforms`
- `check_libraries_interval`
- `check_platformio_interval`
- `check_platforms_interval`
- `enable_cache`
- `enable_telemetry`
- `force.verbose`
- `projects_dir`

**Examples**

- `pio settings set`
- `pio settings reset`

**Usage**

```bash
pio settings get [NAME]
```

**Description**

**Note:**

- The *Yes* value is equal to: *True*, *Y*, *1* and is not case sensitive.
- You can override these settings using `Environment variables`.

Get/List existing settings

**Settings**
**auto_update_libraries**

*Default* No

*Values* Yes/No

Automatically update libraries.

**auto_update_platforms**

*Default* No

*Values* Yes/No

Automatically update platforms.

**check_libraries_interval**

*Default* 7

*Values* Days (Number)

Check for the library updates interval.

**check_platformio_interval**

*Default* 3

*Values* Days (Number)

Check for the new PlatformIO interval.

**check_platforms_interval**

*Default* 7

*Values* Days (Number)

Check for the platform updates interval.

**enable_cache**

*Default* Yes

*Values* Yes/No

Enable caching for API requests and Library Manager.

**enable_telemetry**

*Default* Yes

*Values* Yes/No
Share minimal diagnostics and usage information to help us make PlatformIO better.
The source code of telemetry service is open source. You can make sure that we DO NOT SHARE PRIVATE information or source code of your project. All information shares ANONYMously.

Which data do we collect and why?

- **A version of Python Interpreter.** PlatformIO Core (CLI) is written in Python language, including development Development Platforms. We need to know which Python version produces such type of exceptions (see below), which is more popular, which version we should drop and focus on a new one

- **PlatformIO Core (CLI) errors/exceptions.** We report automatically fatal exceptions raised by PlatformIO Core source code but NOT by your project

- **The name of the used platform, board, framework.** We collect this type of information to have a clear picture which software products are the most widely used by our Community and for the which we should provide frequent updates and add new features (for example, “atmelavr”, “arduino”, “uno”, etc.)

- **The name of CLI command.** It helps us to improve our CLI. For example, “run”, “lib list”)

- The name of **Cloud & Desktop IDE.** This is very important information for us. We create native extensions based on the popularity of IDEs (for example, VSCode, CLion)

Thanks a lot that you keep this setting enabled!

---

### force_verbose

**Default** No  
**Values** Yes/No

Force verbose output when processing environments. This setting overrides

- `pio run --verbose`
- `pio ci --verbose`
- `pio test --verbose`

---

### projects_dir

**Default** ~/Documents/PlatformIO/Projects  
**Values** Path to folder

Default location for PlatformIO projects (PlatformIO Home)

---

### Examples

1. List all settings and theirs current values

```
> pio settings get
```

<table>
<thead>
<tr>
<th>Name</th>
<th>Value [Default]</th>

pio system

Miscellaneous system commands.

To print all available commands and options use:

```plaintext
pio system --help
pio system COMMAND --help
```

PlatformIO Shell Completion

Shell completion support for
To print all available commands and options use:

```bash
pio system completion --help
pio system completion COMMAND --help
```

### `pio system completion install`

#### Usage

```bash
pio system completion install [OPTIONS]
```

#### Description

Install shell completion files or code.

#### Options

`--shell`

The shell type, default is `auto` and will be detected from a current shell session.

Supported shells are:

- fish
- zsh
- bash
- powershell

`--path`

Custom installation path of the code to be evaluated by the shell. The standard installation path is used by default.
Examples

> pio system completion install

PlatformIO CLI completion has been installed for fish shell to ~/.config/fish/→completions/pio.fish
Please restart a current shell session

pio system completion uninstall

Contents

- pio system completion uninstall
  - Usage
  - Description
    * Options
  - Examples

Usage

pio system completion uninstall [OPTIONS]

Description

Uninstall shell completion files or code.

Options

--shell
The shell type, default is auto and will be detected from a current shell session.
Supported shells are:
- fish
- zsh
- bash
- powershell

--path
Custom installation path of the code to be evaluated by the shell. The standard installation path is used by default.
Examples

```bash
> pio system completion uninstall
PlatformIO CLI completion has been uninstalled for fish shell from ~/.config/fish/completions/pio.fish
Please restart a current shell session.
```

pio system info

New in version 5.0.

## Contents

- pio system info
  - Usage
  - Description
  - Options
  - Examples

## Usage

`pio system info`

## Description

Display PlatformIO system-wide information

## Options

**--json-output**

Return the output in JSON format

## Examples

```bash
> pio system info

PlatformIO Core: 5.0.0
Python: 3.8.5-final.0
System Type: darwin_x86_64
Platform: macOS-10.15.6
File System Encoding: utf-8
Locale Encoding: UTF-8
```

(continues on next page)
pio system prune

New in version 5.0.

Contents

- pio system prune
  - Usage
  - Description
  - Options
  - Examples

Usage

```shell
pio system prune
```

Description

Remove unused data:

- cached API requests
- cached package downloads
- temporary data.

Options

`--force, -f`

Do not prompt for confirmation.

Examples

```shell
> pio system prune
WARNING! This will remove:
- cached API requests
```
cached package downloads
- temporary data
Do you want to continue? [y/N]: y
Total reclaimed space: 36.48KB

pio team

New in version 5.0.

Manage organization teams and team memberships.

Management of organizations and owners is done with the `pio org` command.

To print all available commands and options use:

```
pio org --help
pio org COMMAND --help
```

pio team add

New in version 5.0.

Contents

- pio team add
  - Usage
  - Description
  - Examples
  - See Also

Usage

```
pio team add ORGNAME:TEAMNAME USERNAME
```

Description

Add a new member to a team.

If you need to create a new team, please use `pio team create` command.

Examples

Add Bob to the “developers” team of “platformio” organization

```
> pio team add platformio:developers bob
The new member "bob" has been successfully added to the "developers" team.
```
See Also

- pio team create
- pio team list
- pio team remove

pio team create

New in version 5.0.

Usage

`pio team create [OPTIONS] ORGNAME:TEAMNAME`

Description

Create a new team.

Options

--description

A team description.

Examples

```
> pio team create platformio:dev --description "Developers team"
The team "dev" has been successfully created.
```

See Also

- pio team list
- pio team remove
pio team destroy

New in version 5.0.

Contents

- pio team destroy
  - Usage
  - Description
  - See Also

Usage

pio team destroy ORGNAME:TEAMNAME

Description

Destroy a team.

If you need to remove a user from a team, please use pio team remove command.

See Also

- pio team create
- pio team list
- pio team update

pio team list

New in version 5.0.

Contents

- pio team list
  - Usage
  - Description
    - Options
  - Examples
Usage

```plaintext
pio team list [OPTIONS] [ORGNAME]
```

Description

List teams and their members.

Options

```
--json-output
```

Return the output in JSON format.

Examples

```
> pio team list

platformio:dev
------------------------
Description: Developers team
Members: alice, bob
```

### pio team remove

New in version 5.0.

Usage

```plaintext
pio team remove ORGNAME:TEAMNAME USERNAME
```

Description

Remove a member from a team.

If you need to destroy an existing team, please use `pio team destroy` command.
Examples

Remove Bob from the “dev” team of “platformio” organization:

```
> pio team remove platformio:dev bob
The "bob" member has been successfully removed from the "dev" team.
```

See Also

- `pio team add`
- `pio team list`

pio team update

New in version 5.0.

## Contents

- `pio team update`
  - Usage
  - Description
    - Options
  - Examples
  - See Also

## Usage

```
pio team update [OPTIONS] ORGNAME:TEAMNAME
```

## Description

Rename a team or update the existing details.

## Options

- **--name**
  
  A new team name. Team name must only contain alphanumeric characters, single hyphens, underscores, spaces. It can not begin or end with a hyphen or a underscore and must not be longer than 20 characters.

- **--description**
  
  A team description.
Examples

```shell
> pio team update platformio:dev --description "Developers team"
The team "dev" has been successfully updated.
```

See Also

- `pio team list`
- `pio team remove`

### pio test

Helper command for local *Unit Testing*.

#### Contents

- `pio test`
  - Usage
  - Description
  - Options
  - Examples

#### Usage

```
pio test [OPTIONS]
```

#### Description

Run locally tests from PlatformIO based project. More details about PlatformIO *Unit Testing*.

This command allows you to apply the tests for the environments specified in “platformio.ini” (*Project Configuration File)*.

#### Options

- `-e, --environment`
  
  Process specified environments. More details `pio run --environment`

- `-f, --filter`
  
  Process only the tests where the name matches specified patterns. More than one pattern is allowed. If you need to filter some tests for a specific environment, please take a look at `test_filter` option from “platformio.ini” (*Project Configuration File)*.
Pattern | Meaning
---|---
* | matches everything
? | matches any single character
[seq] | matches any character in seq
[!seq] | matches any character not in seq

For example, `pio test --filter "mytest*" -i "test[13]"

--ignore

Ignore tests where the name matches specified patterns. More than one pattern is allowed. If you need to ignore some tests for a specific environment, please take a look at `test_ignore` option from "platformio.ini" (Project Configuration File).

For example, `pio test --ignore "mytest*" -i "test[13]"

--upload-port

A port that is intended for firmware uploading. To list available ports please use `pio device list` command. If upload port is not specified, PlatformIO will try to detect it automatically.

--test-port

A Serial/UART port that PlatformIO uses as communication interface between PlatformIO Unit Test Engine and target device. To list available ports please use `pio device list` command. If test port is not specified, PlatformIO will try to detect it automatically.

-d, --project-dir

Specify the path to project directory. By default, `--project-dir` is equal to current working directory (CWD).

-c, --project-conf

Process project with a custom "platformio.ini" (Project Configuration File).

--without-building

Skip building stage.

--without-uploading

Skip uploading stage.

--without-testing

Skip testing stage.

--no-reset

Disable software reset via Serial.DTR/RST before test running. In this case, need to press "reset" button manually after firmware uploading.
Warning: If board does not support software reset via `Serial.DTR/RTS` you should add >2 seconds delay before `UNITY_BEGIN()`. We need that time to establish a `Serial` communication between host machine and target device. See Unit Testing.

`--monitor-rts`
Set initial `RTS` line state for Serial Monitor (0 or 1), default 1. We use it to gather test results via Serial connection.

`--monitor-dtr`
Set initial `DTR` line state for Serial Monitor (0 or 1), default 1. We use it to gather test results via Serial connection.

`-v, --verbose`
Shows detailed information when processing environments.
This option can also be set globally using `force_verbose` setting or by environment variable `PLATFORMIO_SETTING_FORCE_VERBOSE`.

Examples
For the examples please follow to Unit Testing page.

pio update

Contents

- pio update
  - Usage
  - Description
  - Options
  - Examples

Usage

```bash
pio update [OPTIONS]
```

Description

Check or update installed PlatformIO Core packages, Development Platforms and global Libraries. This command is combination of 2 sub-commands:

- `pio platform update`
- `pio lib update`

1.3. PlatformIO Core (CLI)
Options

--core-packages
Update only the core packages

-c, --only-check
DEPRECATED. Please use --dry-run instead.

--dry-run
Do not update, only check for the new versions

Examples

```bash
> pio update

pio upgrade

Contents

• pio upgrade
  – Usage
  – Description
  – Options
  – Examples

Usage

pio upgrade

Description

Check or upgrade PlatformIO to the latest version
Options

`--dev`
Use development branch.

Examples

```bash
> pio upgrade
You are up-to-date!
PlatformIO x.x.x is currently the newest version available.

# If you have problem with permissions try:
> sudo pio upgrade
```

1.4 PlatformIO Home

PlatformIO Home allows you to interact with PlatformIO’s professional collaborative platform using modern and cross-platform GUI:

- Project Manager
- PlatformIO Account
- Library Management
- Development Platforms
- Library and development platform updates
- Frameworks
- Boards
- Device Manager: serial, logical, and multicast DNS services
- Static Code Analysis
- Firmware File Explorer
- Firmware Memory Inspection
- Firmware Sections & Symbols Viewer.

Contents

- Installation
- Quick Start
  - PlatformIO IDE
  - PlatformIO Core
- Demo
  - Welcome & Project Manager
1.4.1 Installation

You do not need to install PlatformIO Home separately, it’s already built-in in PlatformIO IDE and PlatformIO Core (CLI).

1.4.2 Quick Start

PlatformIO IDE

Please open PlatformIO Home using (HOME) button on PlatformIO Toolbar:

- **Atom**: PlatformIO Toolbar
- **VSCode**: PlatformIO Toolbar

PlatformIO Core

Please launch PlatformIO Home Web-server using `pio home` command and open in your browser http://127.0.0.1:8008.

You can change host and port. Please check `pio home` command for details.

## Board Explorer

PlatformIO currently supports over 400 boards from leading manufacturers, and we are constantly adding new ones. You can be part of the process by letting us know what board you wish to see supported next, by submitting a feature request.

## 1.5 Tutorials and Examples

### 1.5.1 Tutorials

Unit Testing of a “Blink” Project

The goal of this tutorial is to demonstrate how simple it is to use Unit Testing.

- **Level:** Beginner
- **Platforms:** Windows, macOS, Linux

## Contents

- Setting Up the Project
- Project structure
- Source files
- Test results

## Setting Up the Project

1. Please navigate to the Quick Start section and create the “Blink Project”.
2. Create a test directory in the project (on the same level as src) and place a test_main.cpp file in it (the source code is located below).
3. Run tests using the pio test command.

### Project structure

```
project_dir
  └── lib
      └── README
  └── platformio.ini
  └── src
      └── ...
  └── test
      └── test_main.cpp
```

### Source files

- **platformio.ini**

```ini
[env:uno]
```

(continues on next page)
platform = atmelavr
framework = arduino
board = uno

[env:teensy31]
platform = teensy
framework = arduino
board = teensy31

• test/test_main.cpp

#include <Arduino.h>
#include <unity.h>

// void setUp(void) {
//   // set stuff up here
// }

// void tearDown(void) {
//   // clean stuff up here
// }

void test_led_builtin_pin_number(void) {
    TEST_ASSERT_EQUAL(13, LED_BUILTIN);
}

void test_led_state_high(void) {
    digitalWrite(LED_BUILTIN, HIGH);
    TEST_ASSERT_EQUAL(HIGH, digitalRead(LED_BUILTIN));
}

void test_led_state_low(void) {
    digitalWrite(LED_BUILTIN, LOW);
    TEST_ASSERT_EQUAL(LOW, digitalRead(LED_BUILTIN));
}

void setup() {
    // NOTE!!! Wait for >2 secs
    // if board doesn't support software reset via Serial.DTR/RTS
    delay(2000);

    UNITY_BEGIN(); // IMPORTANT LINE!
    RUN_TEST(test_led_builtin_pin_number);
    pinMode(LED_BUILTIN, OUTPUT);
}

uint8_t i = 0;
uint8_t max_blinks = 5;

void loop() {
    if (i < max_blinks) {
        RUN_TEST(test_led_state_high);
        delay(500);
        RUN_TEST(test_led_state_low);
        delay(500);
    }
}
```c
i++;
}
else if (i == max_blinks) {
    UNITY_END(); // stop unit testing
}
```

Test results

```bash
> pio test -e uno --verbose

Verbose mode can be enabled via `--verbose` option

Get started with Arduino and ESP32-DevKitC: debugging and unit testing

The goal of this tutorial is to demonstrate how simple it is to use VSCode to develop, run and debug a simple project with the Arduino framework for the ESP32-DevKitC board.

- **Level:** Beginner
- **Platforms:** Windows, Mac OS X, Linux

**Requirements:**

- Downloaded and installed VSCode
- Espressif ESP32 Dev Module
- Olimex ARM-USB-OCD or Olimex ARM-USB-TINY adapter for debugging
Setting Up the Project

First, we need to create a new project using the PlatformIO Home Page (to open this page, just press the Home icon on the toolbar):

Next, we need to select **Espressif ESP32 Dev Module** as a development board, **Arduino** as a framework and a path to the project location (or use the default one):
After that, we have a fully configured project that is ready for developing code with the Arduino framework.

Adding Code to the Generated Project

Let’s add some actual code to the project. Firstly, we open a default main file named `main.cpp` in the `src_dir` folder and replace its content with following:

```cpp
#include <Arduino.h>

void setup() {
    Serial.begin(9600);
}

void loop() {
    Serial.println("Hello world!");
    delay(1000);
}
```
We have now created a basic project ready for compiling and uploading.

**Compiling and Uploading the Firmware**

Now we can build the project. There are several ways to compile firmware:

- Build option in the **Project Tasks** menu,
- Build button in **PlatformIO Toolbar**,
- **Task Menu**: Tasks: Run Task... > PlatformIO: Build, or in the **PlatformIO Toolbar**,
- **Command Palette**: View: Command Palette > PlatformIO: Build, or
- via hotkeys cmd-alt-b / ctrl-alt-b

Marked in red:
If everything went well, we should see a Success message in the terminal window:
There are also several ways to upload the firmware to the board:

- Upload option in the Project Tasks menu,
- Upload button in PlatformIO Toolbar,
- Command Palette: View: Command Palette > PlatformIO: Upload,
- using the Task Menu: Tasks: Run Task... > PlatformIO: Upload, or
- via hotkeys: cmd-alt-u / ctrl-alt-u:
After uploading, we need to check if the firmware is uploaded correctly. To do this, open the serial monitor and check that the message from the board is received. To open the serial monitor, we can use the following options:

- Monitor option in the **Project Tasks** menu,
- Serial Monitor button in the **PlatformIO Toolbar**,
- **Command Palette**: View: Command Palette > PlatformIO: Monitor, or
- **Task Menu**: Tasks: Run Task... > PlatformIO: Monitor:
If the firmware works as expected, the message from the board can be observed in the terminal window:
Debugging the Firmware

Setting Up the Hardware

In order to use a JTAG probe with an ESP32, we need to connect the following pins:

<table>
<thead>
<tr>
<th>ESP32 pin</th>
<th>JTAG probe pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.3V</td>
<td>Pin 1 (VTref)</td>
</tr>
<tr>
<td>GPIO 9 (EN)</td>
<td>Pin 3 (nTRST)</td>
</tr>
<tr>
<td>GND</td>
<td>Pin 4 (GND)</td>
</tr>
<tr>
<td>GPIO 12 (TDI)</td>
<td>Pin 5 (TDI)</td>
</tr>
<tr>
<td>GPIO 14 (TMS)</td>
<td>Pin 7 (TMS)</td>
</tr>
<tr>
<td>GPIO 13 (TCK)</td>
<td>Pin 9 (TCK)</td>
</tr>
<tr>
<td>GPIO 15 (TDO)</td>
<td>Pin 13 (TDO)</td>
</tr>
</tbody>
</table>

Debugging offers the easiest way to debug the board. Firstly, we need to specify debug_tool in “platformio.ini” (Project Configuration File). In this tutorial, an Olimex ARM-USB-OCD-H debug probe is used:

```
[env:esp32dev]
platform = espressif32
board = esp32dev
```

(continues on next page)
To start the debug session we can use the following methods:

- Debug: Start debugging in the top menu,
- Start Debugging option in the Quick Access menu, or
- hotkey button F5:

We need to wait some time while PlatformIO initializes the debug session, and are ready to debug when the first line after the main function is highlighted.

1. Please wait when debugging session is stopped at the first line of `app_main()` function
2. **WARNING!** Please set a breakpoint at `void loopTask(void *pvParameters)` (line 13 in the screenshot below - this line can change between releases)
3. Now, please press CONTINUE/RUN button on debugging toolbar (right arrow icon)
4. The debugging session should stop at the first line of the `void loopTask(void *pvParameters)` function
5. Now, navigate to your Arduino setup/loop code and do classic debugging.
We can walk through the code using control buttons, set breakpoints, and add variables to the Watch window:
Writing Unit Tests

Test cases can be added to a single file that may include multiple tests. First of all, in this file, we need to add four default functions: `setUp`, `tearDown`, `setup` and `loop`. Functions `setUp` and `tearDown` are used to initialize and finalize test conditions. Implementations of these functions are not required for running tests, but if you need to initialize some variables before you run a test, use the `setUp` function. Likewise, if you need to clean up variables, use `tearDown` function. In our example we will use these functions to respectively initialize and deinitialize LED states. The `setup` and `loop` functions act as a simple Arduino program where we describe our test plan.

Let’s create a `test` folder in the root of the project and add a new file, `test_main.cpp`, to this folder. Next, basic tests for `String` class will be implemented in this file:

- `test_string_concat` tests the concatenation of two strings
- `test_string_substring` tests the correctness of the substring extraction
- `test_string_index_of` ensures that the string returns the correct index of the specified symbol
- `test_string_equal_ignore_case` tests case-insensitive comparison of two strings
- `test_string_to_upper_case` tests conversion of the string to upper-case
- `test_string_replace` tests the correctness of the replacing operation

```cpp
#include <Arduino.h>
#include <unity.h>
```

(continues on next page)
String STR_TO_TEST;

void setUp(void) {
    // set stuff up here
    STR_TO_TEST = "Hello, world!";
}

void tearDown(void) {
    // clean stuff up here
    STR_TO_TEST = "";
}

void test_string_concat(void) {
    String hello = "Hello, ";
    String world = "world!";
    TEST_ASSERT_EQUAL_STRING(STR_TO_TEST.c_str(), (hello + world).c_str());
}

void test_string_substring(void) {
    TEST_ASSERT_EQUAL_STRING("Hello", STR_TO_TEST.substring(0, 5).c_str());
}

void test_string_index_of(void) {
    TEST_ASSERT_EQUAL(7, STR_TO_TEST.indexOf('w'));
}

void test_string_equal_ignore_case(void) {
    TEST_ASSERT_TRUE(STR_TO_TEST.equalsIgnoreCase("HELLO, WORLD"));
}

void test_string_to_upper_case(void) {
    STR_TO_TEST.toUpperCase();
    TEST_ASSERT_EQUAL_STRING("HELLO, WORLD!", STR_TO_TEST.c_str());
}

void test_string_replace(void) {
    STR_TO_TEST.replace('!', '?');
    TEST_ASSERT_EQUAL_STRING("Hello, world?", STR_TO_TEST.c_str());
}

void setup()
{
    delay(2000); // service delay
    UNITY_BEGIN();

    RUN_TEST(test_string_concat);
    RUN_TEST(test_string_substring);
    RUN_TEST(test_string_index_of);
    RUN_TEST(test_string_equal_ignore_case);
    RUN_TEST(test_string_to_upper_case);
    RUN_TEST(test_string_replace);

    UNITY_END(); // stop unit testing
}

void loop()
Now we are ready to upload tests to the board. To do this we can use the following:

- Test button on *PlatformIO Toolbar*,
- Test option in the *Project Tasks* menu, or
- **Tasks: Run Task... > PlatformIO Test** in the top menu:

After processing, we should see a detailed report about the testing results:
As we can see from the report, all our tests were successful!

**Adding Bluetooth LE features**

Now let's create a basic application that can interact with other BLE devices (e.g., phones). For example, the following code declares a BLE characteristic whose value can be printed to the serial port:

```cpp
#include <Arduino.h>
#include <BLEDevice.h>
#include <BLEUtils.h>
#include <BLEServer.h>

#define SERVICE_UUID "4fac201-1fb5-459e-8fcc-c5c9c31914b"
#define CHARACTERISTIC_UUID "beb5483e-36e1-4688-b7f5-ea07361b26a8"

class MyCallbacks: public BLECharacteristicCallbacks {
  void onWrite(BLECharacteristic *pCharacteristic) {
    std::string value = pCharacteristic->getValue();
    if (value.length() > 0) {
      Serial.print("\nNew value: ");
      for (int i = 0; i < value.length(); i++)
        Serial.print(value[i]);
      Serial.println();
    }
  }
}
```

(continues on next page)
void setup() {
    Serial.begin(9600);
    BLEDevice::init("ESP32 BLE example");
    BLEServer *pServer = BLEDevice::createServer();
    BLEService *pService = pServer->createService(SERVICE_UUID);
    BLECharacteristic *pCharacteristic = pService->createCharacteristic(
        CHARACTERISTIC_UUID,
        BLECharacteristic::PROPERTY_READ | 
        BLECharacteristic::PROPERTY_WRITE
    );
    pCharacteristic->setCallbacks(new MyCallbacks());
    pCharacteristic->setValue("Hello World");
    pService->start();
    BLEAdvertising *pAdvertising = pServer->getAdvertising();
    pAdvertising->start();
}

void loop() {
    delay(2000);
}

Now we can compile and upload this program to the board as described in the previous sections. To verify that our application works as expected, we can use any Android smartphone with the BLE feature and Nordic nRF Connect tool.

At first, we need to scan all advertising BLE devices and connect to the device called ESP32 BLE example. After successful connection to the board, we should see one “Unknown Service” with one “Unknown Characteristic” field:
To set the value, we need to send new text to the BLE characteristic:
The change of the value is printed to the serial monitor:
Conclusion

Now we have a project template for the ESP32-DevKitC board that we can use as boilerplate for later projects.

Get started with ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis

The goal of this tutorial is to demonstrate how simple it is to use VSCode to develop, run and debug a simple Wi-Fi project with the Espressif IoT Development Framework framework for the ESP32-DevKitC board.

- **Level:** Intermediate
- **Platforms:** Windows, Mac OS X, Linux

**Requirements:**

- Downloaded and installed VSCode
- Espressif ESP32 Dev Module
- An external debug adapter (e.g. Olimex ARM-USB-OCD)

**Contents**

- Setting Up the Project
• Adding Code to the Generated Project
• Debugging the Firmware
  – Setting Up the Hardware
• Writing Unit Tests
• Project Inspection
• Conclusion

Setting Up the Project

1. Click on “PlatformIO Home” button on the bottom PlatformIO Toolbar:

2. Click on “New Project”, select Espressif ESP32 Dev Module as the development board, Espressif IoT Development Framework as the framework and a path to the project location (or use the default one):
1. Create a new file `main.c` in `src_dir` folder and add the following code:

```c
/* WiFi softAP Example

This example code is in the Public Domain (or CC0 licensed, at your option.)

Unless required by applicable law or agreed to in writing, this software is distributed on an "AS IS" BASIS, WITHOUT WARRANTIES OR CONDITIONS OF ANY KIND, either express or implied.
*/
#include <string.h>
#include "freertos/FreeRTOS.h"
#include "freertos/task.h"
#include "esp_system.h"
#include "esp_wifi.h"
#include "esp_event.h"
#include "esp_log.h"
#include "nvs_flash.h"
#include "lwip/err.h"
#include "lwip/sys.h"
#include "lwip/err.h"
#include "lwip/sys.h"
```

(continues on next page)
#define EXAMPLE_ESP_WIFI_SSID "mywifissid"
#define EXAMPLE_ESP_WIFI_PASS "mywifipass"
#define EXAMPLE_MAX_STA_CONN (3)

static const char *TAG = "wifi softAP";

static void wifi_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    if (event_id == WIFI_EVENT_AP_STACONNECTED) {
        wifi_event_ap_staconnected_t* event = (wifi_event_ap_staconnected_t*) event_data;
        ESP_LOGI(TAG, "station MACSTR join, AID=%d", MAC2STR(event->mac), event->aid);
    } else if (event_id == WIFI_EVENT_AP_STADISCONNECTED) {
        wifi_event_ap_stadisconnected_t* event = (wifi_event_ap_stadisconnected_t*) event_data;
        ESP_LOGI(TAG, "station MACSTR leave, AID=%d", MAC2STR(event->mac), event->aid);
    }
}

void wifi_init_softap()
{
    tcpip_adapter_init();
    ESP_ERROR_CHECK(esp_event_loop_create_default());

    wifi_init_config_t cfg = WIFI_INIT_CONFIG_DEFAULT();
    ESP_ERROR_CHECK(esp_wifi_init(&cfg));

    ESP_ERROR_CHECK(esp_event_handler_register(WIFI_EVENT, ESP_EVENT_ANY_ID, &wifi_event_handler, NULL));

    wifi_config_t wifi_config = {
        .ap = {
            .ssid = EXAMPLE_ESP_WIFI_SSID,
            .ssid_len = strlen(EXAMPLE_ESP_WIFI_SSID),
            .password = EXAMPLE_ESP_WIFI_PASS,
            .max_connection = EXAMPLE_MAX_STA_CONN,
            .authmode = WIFI_AUTH_WPA_WPA2_PSK
        },
    };

    if (strlen(EXAMPLE_ESP_WIFI_PASS) == 0) {
        wifi_config.ap.authmode = WIFI_AUTH_OPEN;
    }

    ESP_ERROR_CHECK(esp_wifi_set_mode(WIFI_MODE_AP));
    ESP_ERROR_CHECK(esp_wifi_set_config(ESP_IF_WIFI_AP, &wifi_config));
    ESP_ERROR_CHECK(esp_wifi_start());

    ESP_LOGI(TAG, "wifi_init_softap finished. SSID:%s password:%s", EXAMPLE_ESP_WIFI_SSID, EXAMPLE_ESP_WIFI_PASS);
}

void app_main()
//Initialize NVS
esp_err_t ret = nvs_flash_init();
if (ret == ESP_ERR_NVS_NO_FREE_PAGES || ret == ESP_ERR_NVS_NEW_VERSION_FOUND) {
    ESP_ERROR_CHECK(nvs_flash_erase());
    ret = nvs_flash_init();
}
ESP_ERROR_CHECK(ret);
ESP_LOGI(TAG, "ESP_WIFI_MODE_AP");
wifi_init_softap();

**Warning:** Make sure this new file `main.c` is registered as source file using `idf_component_register` function in `src/CMakeLists.txt` file:

```c
idf_component_register(SRCS "main.c")
```

2. To compile the project use one of the following options:
   - Build option from the **Project Tasks** menu
   - Build button in **PlatformIO Toolbar**
   - **Task Menu** Tasks: Run Task... > **PlatformIO: Build** or in **PlatformIO Toolbar**
   - **Command Palette** View: Command Palette > **PlatformIO: Build**
   - **Hotkeys** cmd-alt-b / ctrl-alt-b:
3. If everything went well, we should see a successful result message in the terminal window:
4. To upload the firmware to the board we can use the following options:

- Upload option from the Project Tasks menu
- Upload button in PlatformIO Toolbar
- Command Palette View: Command Palette > PlatformIO: Upload
- Task Menu Tasks: Run Task... > PlatformIO: Upload
- Hotkeys cmd-alt-u / ctrl-alt-u:
5. Connect the board to your computer and update the default monitor speed to 115200 in platformio.ini file:

```
[env:esp32dev]
platform = espressif32
board = esp32dev
framework = espidf
monitor_speed = 115200
```

6. Open Serial Monitor to observe the output from the board:
7. If everything went well, the board should be visible as a WiFi access point:
Debugging the Firmware

Setting Up the Hardware

In order to use *Debugging*, we need to connect an external JTAG probe and the board using the following pins:
1. Specify `debug_tool` in “platformio.ini” (Project Configuration File). In this tutorial, Olimex ARM-USB-OCD-H debug probe is used:

```ini
[env:esp32dev]
platform = espressif32
board = esp32dev
framework = espidf
monitor_speed = 115200
debug_tool = olimex-arm-usb-ocd-h
```

2. To start the debug session we can use the following methods:

   - **Debug**: Start debugging in the top menu
   - **Start Debugging** option in the Quick Access menu
   - Hotkey button F5:
3. Walk through the code using control buttons, set breakpoints, and add variables to the Watch window:

![Debug View](image)

Writing Unit Tests

**Note:** Functions `setUp` and `tearDown` are used to initialize and finalize test conditions. Implementations of these functions are not required for running tests but if you need to initialize some variables before you run a test, you use the `setUp` function and if you need to clean up variables you use `tearDown` function.

For the sake of simplicity, let’s create a small library called `calculator`, implement several basic functions `addition`, `subtraction`, `multiplication`, `division` and test them using *Unit Testing* engine.

1. Create a new folder `calculator` in the `lib_dir` folder and add two new files `calculator.h` and `calculator.c` with the following contents:

```c
#include "calculator.h"

int addition (int a, int b);
```

(continues on next page)
int subtraction (int a, int b);
int multiplication (int a, int b);
int division (int a, int b);

#ifdef __cplusplus
}
#endif
#endif
// _CALCULATOR_H_

calculator.c:

#include "calculator.h"

int addition(int a, int b) {
    return a + b;
}

int subtraction(int a, int b) {
    return a - b;
}

int multiplication(int a, int b) {
    return a * b;
}

int division(int a, int b) {
    return a / b;
}

2. Create a new file test_calc.c to the folder test_dir and add basic tests for the calculator library:

#include <calculator.h>
#include <unity.h>

void test_function_calculator_addition(void) {
    TEST_ASSERT_EQUAL(32, addition(25, 7));
}

void test_function_calculator_subtraction(void) {
    TEST_ASSERT_EQUAL(20, subtraction(23, 3));
}

void test_function_calculator_multiplication(void) {
    TEST_ASSERT_EQUAL(50, multiplication(25, 2));
}

void test_function_calculator_division(void) {
    TEST_ASSERT_EQUAL(32, division(100, 3));
}

void main() {
    UNITY_BEGIN();

(continues on next page)
RUN_TEST(test_function_calculator_addition);
RUN_TEST(test_function_calculator_subtraction);
RUN_TEST(test_function_calculator_multiplication);
RUN_TEST(test_function_calculator_division);

UNITY_END();

3. Let’s run tests on the board and check the results. There should be a problem with test_function_calculator_division test:

4. Let’s fix the incorrect expected value and run tests again. After processing the results should be correct:
**Project Inspection**

For illustrative purposes, let’s imagine we need to find a function with the biggest memory footprint. Also, let’s introduce a bug to our project so *Static Code Analysis* can report it.

1. Open **PlatformIO Home** and navigate to **Inspect** section, select the current project and press **Inspect** button:
2. Project statistics:
3. The biggest function:
4. Possible bugs:
Conclusion

Now we have a project template for the ESP32-DevKitC board that we can use as boilerplate for later projects.

**STM32Cube HAL and Nucleo-F401RE: debugging and unit testing**

The goal of this tutorial is to demonstrate how simple it is to use PlatformIO IDE for Atom to develop, run and debug a basic blink project with STM32Cube framework for STM32 Nucleo-F401RE board.

- **Level:** Intermediate
- **Platforms:** Windows, Mac OS X, Linux

**Requirements:**

- Downloaded and installed PlatformIO IDE for Atom
- Install drivers for ST-LINK debug tool
- ST Nucleo F401RE development board

**Contents**

- Setting Up the Project
- Adding Code to the Generated Project
Setting Up the Project

At first step, we need to create a new project using PlatformIO Home Page (to open this page just press Home icon on the toolbar):

On the next step, we need to select ST Nucleo-F401RE as a development board, STM32Cube as a framework and a path to the project location (or use the default one):
Processing the selected project may take some amount of time (PlatformIO will download and install all required packages) and after these steps, we have a fully configured project that is ready for developing code with STM32Cube framework.

Adding Code to the Generated Project

Let’s add some actual code to the project. Firstly, we create two main files main.c and main.h in the src_dir folder. Right click on the src in the project window:
Add next content to `main.h`:

```c
#ifndef MAIN_H
#define MAIN_H

#include "stm32f4xx_hal.h"

#define LED_PIN GPIO_PIN_5
#define LED_GPIO_PORT GPIOA
#define LED_GPIO_CLK_ENABLE() __HAL_RCC_GPIOA_CLK_ENABLE()

#endif // MAIN_H
```

Add this code to `main.c`:

```c
#include "main.h"

void LED_Init();

int main(void) {
    HAL_Init();
    LED_Init();

    while (1)
    {
```

(continues on next page)
HAL_GPIO_TogglePin(LED_GPIO_PORT, LED_PIN);
HAL_Delay(1000);
}

void LED_Init() {
    LED_GPIO_CLK_ENABLE();
    GPIO_InitTypeDef GPIO_InitStruct;
    GPIO_InitStruct.Pin = LED_PIN;
    GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
    GPIO_InitStruct.Pull = GPIO_PULLUP;
    GPIO_InitStruct.Speed = GPIO_SPEED_HIGH;
    HAL_GPIO_Init(LED_GPIO_PORT, &GPIO_InitStruct);
}

void SysTick_Handler(void) {
    HAL_IncTick();
}

After this step, we created a basic blink project that is ready for compiling and uploading.

**Compiling and Uploading the Firmware**

Now we can build the project. To compile firmware we can use next options: Build option on the Project Tasks menu, Build button on PlatformIO Toolbar, using Command Palette View: Command Palette > PlatformIO: Build, using Task Menu Tasks: Run Task... > PlatformIO: Build or via hotkeys cmd-alt-b / ctrl-alt-b:
If everything went well, we should see the successful result in the terminal window:
To upload the firmware to the board we can use next options: Upload option on the Project Tasks menu, Upload button on PlatformIO Toolbar, using Command Palette View: Command Palette > PlatformIO: Upload, using Task Menu Tasks: Run Task... > PlatformIO: Upload or via hotkeys cmd-alt-u / ctrl-alt-u:
After successful uploading, the green LED2 should start blinking.

**Debugging the Firmware**

*Debugging* offers the easiest way to debug your board. To start debugging session you can use *Start debugging* option in PlatformIO Quick Access menu, *Debug: Start debugging* from the top menu or hotkey button F5:
We need to wait some time while PlatformIO is initializing debug session and when the first line after the main function is highlighted we are ready to debug:
We can walk through the code using control buttons, set breakpoints, see peripheral registers, add variables to **Watch** window:
Writing Unit Tests

Now let’s write some tests using Unit Testing feature that can help us test code directly on the target board. Unit Testing engine by default supports only three frameworks: Arduino, Espressif IoT Development Framework, Mbed. Since we decided to use STM32Cube we need to implement a custom test_transport to print testing results and specify that condition in “platformio.ini” (Project Configuration File):

```
[env:nucleo_f401re]
platform = ststm32
board = nucleo_f401re
framework = stm32cube
test_transport = custom
```

Also, we need to create a new folder test where the tests and custom test_transport implementation (described next) will be located:
We will use USART2 on ST Nucleo-F401RE board because it’s directly connected to the STLink debug interface and in OS it can be visible as a Virtual Com Port, so we don’t need any additional USB-UART converter. To implement the custom test_transport we need to create two files unittest_transport.h and unittest_transport.c and put them in the test_dir in the root folder of our project. In these files we need to implement the next four functions:

```c
void unittest_uart_begin();
void unittest_uart_putchar(char c);
void unittest_uart_flush();
void unittest_uart_end();
```

Implementation of unittest_transport.h:

```c
#ifndef UNITEST_TRANSPORT_H
#define UNITEST_TRANSPORT_H

#ifdef __cplusplus
extern "C" {
#endif

void unittest_uart_begin();
void unittest_uart_putchar(char c);
void unittest_uart_flush();
void unittest_uart_end();

#ifdef __cplusplus
}
#endif
#endif
```

(continues on next page)
Implementation of unittest_transport.c:

```
#include "unittest_transport.h"
#include "stm32f4xx_hal.h"

#define USARTx USART2
#define USARTx_CLK_ENABLE() __HAL_RCC_USART2_CLK_ENABLE()
#define USARTx_CLK_DISABLE() __HAL_RCC_USART2_CLK_DISABLE()
#define USARTx_RX_GPIO_CLK_ENABLE() __HAL_RCC_GPIOA_CLK_ENABLE()
#define USARTx_TX_GPIO_CLK_ENABLE() __HAL_RCC_GPIOA_CLK_ENABLE()
#define USARTx_RX_GPIO_CLK_DISABLE() __HAL_RCC_GPIOA_CLK_DISABLE()
#define USARTx_TX_GPIO_CLK_DISABLE() __HAL_RCC_GPIOA_CLK_DISABLE()
#define USARTx_FORCE_RESET() __HAL_RCC_USART2_FORCE_RESET()
#define USARTx_RELEASE_RESET() __HAL_RCC_USART2_RELEASE_RESET()

#define USARTx_TX_PIN GPIO_PIN_2
#define USARTx_TX_GPIO_PORT GPIOA
#define USARTx_TX_AF GPIO_AF7_USART2
#define USARTx_RX_PIN GPIO_PIN_3
#define USARTx_RX_GPIO_PORT GPIOA
#define USARTx_RX_AF GPIO_AF7_USART2

static UART_HandleTypeDef UartHandle;

void unittest_uart_begin()
{

  GPIO_InitTypeDef GPIO_InitStruct;

  USARTx_TX_GPIO_CLK_ENABLE();
  USARTx_RX_GPIO_CLK_ENABLE();
  USARTx_CLK_ENABLE();

  GPIO_InitStruct.Pin = USARTx_TX_PIN;
  GPIO_InitStruct.Mode = GPIO_MODE_AF_PP;
  GPIO_InitStruct.Pull = GPIO_PULLUP;
  GPIO_InitStruct.Speed = GPIO_SPEED_FAST;
  GPIO_InitStruct.Alternate = USARTx_TX_AF;
  HAL_GPIO_Init(USARTx_TX_GPIO_PORT, &GPIO_InitStruct);

  GPIO_InitStruct.Pin = USARTx_RX_PIN;
  GPIO_InitStruct.Alternate = USARTx_RX_AF;
  HAL_GPIO_Init(USARTx_RX_GPIO_PORT, &GPIO_InitStruct);

  UartHandle.Instance = USARTx;
  UartHandle.Init.BaudRate = 115200;
  UartHandle.Init.WordLength = UART_WORDLENGTH_8B;
  UartHandle.Init.StopBits = UART_STOPBITS_1;

  HAL_UART_Init(&UartHandle);
}
```

(continues on next page)
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.OverSampling = UART_OVERSAMPLING_16;

if (HAL_UART_Init(&UartHandle) != HAL_OK) {
    while(1){}
}

void unittest_uart_putchar(char c) {
    HAL_UART_Transmit(&UartHandle, (uint8_t*)(&c), 1, 1000);
}

void unittest_uart_flush(){}

void unittest_uart_end() {
    USARTx_CLK_DISABLE();
    USARTx_RX_GPIO_CLK_DISABLE();
    USARTx_TX_GPIO_CLK_DISABLE();
}

Now we need to add some test cases. Tests can be added to a single C file that may include multiple tests. First of all, we need to add three default functions: setUp, tearDown and main. setUp and tearDown are used to initialize and finalize test conditions. Implementations of these functions are not required for running tests but if you need to initialize some variables before you run a test, you use the setUp function and if you need to clean up variables you use tearDown function. In our example, we will use these functions to accordingly initialize and deinitialize LED.

main function acts as a simple program where we describe our test plan.

Let’s add a new file test_main.c to the folder test. Next basic tests for blinking routine will be implemented in this file:

• test_led_builtin_pin_number ensures that LED_PIN has the correct value
• test_led_state_high tests functions HAL_GPIO_WritePin and HAL_GPIO_ReadPin with GPIO_PIN_SET value
• test_led_state_low tests functions HAL_GPIO_WritePin and HAL_GPIO_ReadPin with GPIO_PIN_RESET value

Note:
• 2 sec delay is required since the board doesn’t support software resetting via Serial.DTR/RTS

#include "../src/main.h"
#include <unity.h>

void setUp(void) {
    LED_GPIO_CLK_ENABLE();
    GPIO_InitTypeDef GPIO_InitStruct;
    GPIO_InitStruct.Pin = LED_PIN;
    GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
    GPIO_InitStruct.Pull = GPIO_PULLUP;
    GPIO_InitStruct.Speed = GPIO_SPEED_HIGH;
}
void tearDown(void) {
    HAL_GPIO_DeInit(LED_GPIO_PORT, LED_PIN);
}

void test_led_builtin_pin_number(void) {
    TEST_ASSERT_EQUAL(GPIO_PIN_5, LED_PIN);
}

void test_led_state_high(void) {
    HAL_GPIO_WritePin(LED_GPIO_PORT, LED_PIN, GPIO_PIN_SET);
    TEST_ASSERT_EQUAL(GPIO_PIN_SET, HAL_GPIO_ReadPin(LED_GPIO_PORT, LED_PIN));
}

void test_led_state_low(void) {
    HAL_GPIO_WritePin(LED_GPIO_PORT, LED_PIN, GPIO_PIN_RESET);
    TEST_ASSERT_EQUAL(GPIO_PIN_RESET, HAL_GPIO_ReadPin(LED_GPIO_PORT, LED_PIN));
}

int main() {
    HAL_Init(); // initialize the HAL library
    HAL_Delay(2000); // service delay
    UNITY_BEGIN();
    RUN_TEST(test_led_builtin_pin_number);

    for (unsigned int i = 0; i < 5; i++) {
        RUN_TEST(test_led_state_high);
        HAL_Delay(500);
        RUN_TEST(test_led_state_low);
        HAL_Delay(500);
    }

    UNITY_END(); // stop unit testing

    while(1){}
}

void SysTick_Handler(void) {
    HAL_IncTick();
}

Now we are ready to upload tests to the board. To do this we can use Test option from the Project Tasks menu, Tasks: Run Task... > PlatformIO Test option from the top menu or Test button on PlatformIO Toolbar:
After processing we should see a detailed report about the testing results:
Congratulations! As we can see from the report, all our tests went successfully!

**Conclusion**

Now we have a decent template that we can improve for our next more complex projects.

**Project Source Code**

The source code of this tutorial is available at https://github.com/platformio/platformio-examples/tree/develop/unit-testing/stm32cube

**Arduino and Nordic nRF52-DK: debugging and unit testing**

The goal of this tutorial is to demonstrate how simple it is to use VSCode to develop, run and debug a simple project with Arduino framework for Nordic nRF52-DK board.

- **Level**: Beginner
- **Platforms**: Windows, Mac OS X, Linux

**Requirements:**

- Downloaded and installed VSCode
• Install drivers for *J-LINK* debug tool
• *Nordic nRF52-DK* development board

## Contents

- Setting Up the Project
- Adding Code to the Generated Project
- Compiling and Uploading the Firmware
- Debugging the Firmware
- Writing Unit Tests
- Adding Bluetooth LE features
- Conclusion

### Setting Up the Project

At first step, we need to create a new project using PlatformIO Home Page (to open this page just press Home icon on the toolbar):
On the next step we need to select Nordic nRF52-DK as a development board, Arduino as a framework and a path to the project location (or use the default one):

Processing the selected project may take some amount of time (PlatformIO will download and install all required packages) and after these steps, we have a fully configured project that is ready for developing code with Arduino framework.

**Adding Code to the Generated Project**

Let’s add some actual code to the project. Firstly, we open a default main file main.cpp in the src_dir folder and replace its contents with the following:

```cpp
#include <Arduino.h>

void setup()
{
    pinMode(LED_BUILTIN, OUTPUT);
}

void loop()
{
    digitalWrite(LED_BUILTIN, HIGH);
    delay(100);
    digitalWrite(LED_BUILTIN, LOW);
}
```

(continues on next page)
After this step, we created a basic blink project ready for compiling and uploading.

Compiling and Uploading the Firmware

Now we can build the project. To compile firmware we can use next options: Build option from the Project Tasks menu, Build button in PlatformIO Toolbar, Task Menu Tasks: Run Task... > PlatformIO: Build or in PlatformIO Toolbar, Command Palette View: Command Palette > PlatformIO: Build or via hotkeys cmd-alt-b / ctrl-alt-b:
If everything went well, we should see a successful result message in the terminal window:
To upload the firmware to the board we can use next options: Upload option from the Project Tasks menu, Upload button in PlatformIO Toolbar, Command Palette View: Command Palette > PlatformIO: Upload, using Task Menu Tasks: Run Task... > PlatformIO: Upload or via hotkeys cmd-alt-u / ctrl-alt-u:
After successful uploading, the green LED1 should start blinking.

**Debugging the Firmware**

*Debugging* offers the easiest way to debug the board. Firstly, we need to specify *debug_tool* in “platformio.ini” *(Project Configuration File)*. Since the board has an on-board JLink debug probe we can directly declare it in “platformio.ini” *(Project Configuration File):*

```ini
[env:nrf52_dk]
platform = nordicnrf52
board = nrf52_dk
framework = arduino
debug_tool = jlink
```

To start the debug session we can use next options: Debug: Start debugging from the top menu, Start Debugging option from Quick Access menu or hotkey button F5:
We need to wait some time while PlatformIO is initializing the debug session and when the first line after the main function is highlighted we are ready to debug:
We can walk through the code using control buttons, set breakpoints, add variables to Watch window:
Writing Unit Tests

Test cases can be added to a single file that may include multiple tests. First of all, in this file, we need to add four default functions: setUp, tearDown, setup and loop. Functions setUp and tearDown are used to initialize and finalize test conditions. Implementations of these functions are not required for running tests but if you need to initialize some variables before you run a test, you use the setUp function and if you need to clean up variables you use tearDown function. In our example we will use these functions to accordingly initialize and deinitialize LED. setup and loop functions act as a simple Arduino program where we describe our test plan.

Let's create test folder in the root of the project and add a new file test_main.cpp to this folder. Next basic tests for String class will be implemented in this file:

- test_string_concat tests the concatenation of two strings
- test_string_substring tests the correctness of the substring extraction
- test_string_index_of ensures that the string returns the correct index of the specified symbol
- test_string_equal_ignore_case tests case-insensitive comparison of two strings
- test_string_to_upper_case tests upper-case conversion of the string
- test_string_replace tests the correctness of the replacing operation

Note:
• 2 sec delay is required since the board doesn’t support software resetting via Serial.DTR/RTS

```cpp
#include <Arduino.h>
#include <unity.h>

String STR_TO_TEST;

void setUp(void) {
    // set stuff up here
    STR_TO_TEST = "Hello, world!";
}

void tearDown(void) {
    // clean stuff up here
    STR_TO_TEST = "";
}

void test_string_concat(void) {
    String hello = "Hello, ";
    String world = "world!";
    TEST_ASSERT_EQUAL_STRING(STR_TO_TEST.c_str(), (hello + world).c_str());
}

void test_string_substring(void) {
    TEST_ASSERT_EQUAL_STRING("Hello", STR_TO_TEST.substring(0, 5).c_str());
}

void test_string_index_of(void) {
    TEST_ASSERT_EQUAL(7, STR_TO_TEST.indexOf('w'));
}

void test_string_equal_ignore_case(void) {
    TEST_ASSERT_TRUE(STR_TO_TEST.equalsIgnoreCase("HELLO, WORLD!"));
}

void test_string_to_upper_case(void) {
    STR_TO_TEST.toUpperCase();
    TEST_ASSERT_EQUAL_STRING("HELLO, WORLD!", STR_TO_TEST.c_str());
}

void test_string_replace(void) {
    STR_TO_TEST.replace('!', '?');
    TEST_ASSERT_EQUAL_STRING("Hello, world!", STR_TO_TEST.c_str());
}

void setup() {
    delay(2000); // service delay
    unity_BEGIN();

    RUN_TEST(test_string_concat);
    RUN_TEST(test_string_substring);
    RUN_TEST(test_string_index_of);
    RUN_TEST(test_string_equal_ignore_case);
    RUN_TEST(test_string_to_upper_case);
    RUN_TEST(test_string_replace);
}
```
UNITY_END(); // stop unit testing

void loop()
{
}

Now we are ready to upload tests to the board. To do this we can use next options: Test button on PlatformIO Toolbar, Test option from the Project Tasks menu or Tasks: Run Task... > PlatformIO Test from the top menu:

After processing we should see a detailed report about the testing results:
As we can see from the report, all our tests were successful!

**Adding Bluetooth LE features**

To add the basic BLE functionality to our project we need to define the SoftDevice version and install a library called BLEPeripheral. Both these modifications can be specified in "platformio.ini" (Project Configuration File):

```
[env:nrf52_dk]
platform = nordicnrf52
board = nrf52_dk
framework = arduino
debug_tool = jlink
build_flags = -DNRF52_S132
lib_deps = BLEPeripheral
```

Now let’s create a basic application that can interact with other BLE devices (e.g. phone). For example, next code declares a BLE characteristic that controls the state of the LED1.

```
#include <Arduino.h>
#include <SPI.h>
#include <BLEPeripheral.h>
```
BLEPeripheral ledPeripheral = BLEPeripheral();
BLEService ledService = BLEService("19b10000e8f2537e4f6cd104768a1214");
BLECharCharacteristic ledCharacteristic = BLECharCharacteristic("19b10001e8f2537e4f6cd104768a1214", BLERead | BLEWrite);

void setup()
{
  pinMode(LED_BUILTIN, OUTPUT);
  ledPeripheral.setAdvertisedServiceUuid(ledService.uuid());
  ledPeripheral.addAttribute(ledService);
  ledPeripheral.addAttribute(ledCharacteristic);
  ledPeripheral.setLocalName("Nordic NRF52 DK");
  ledPeripheral.begin();
}

void loop()
{
  BLECentral central = ledPeripheral.central();
  if (central) {
    while (central.connected()) {
      if (ledCharacteristic.written()) {
        if (ledCharacteristic.value())
          digitalWrite(LED_BUILTIN, HIGH);
        else
          digitalWrite(LED_BUILTIN, LOW);
      }
    }
  }
}

Now we can compile and upload this program to the board as described in previous sections. To verify that our application works as expected, we can use any Android smartphone with BLE feature and Nordic nRF Connect tool.

At first, we need to scan all advertising BLE devices and connect to the device called Nordic NRF52 DK. After a successful connection to the board, we should see one “Unknown Service” with one “Unknown Characteristic” fields:
To switch the LED on or off we just need write 0 or 1 as UINT8 to the BLE characteristic:
Conclusion

Now we have a project template for Nordic nRF52-DK board that we can use as a boilerplate for the next projects.

**Zephyr and Nordic nRF52-DK: debugging, unit testing, project analysis**

The goal of this tutorial is to demonstrate how simple it is to use VSCode to develop, run and debug a simple Bluetooth project using Zephyr RTOS framework for the Nordic nRF52-DK board.

- **Level:** Intermediate
- **Platforms:** Windows, Mac OS X, Linux

**Requirements:**

- Downloaded and installed VSCode
- Install drivers for J-LINK debug tool
- Nordic nRF52-DK development board
Setting Up the Project

1. Click on “PlatformIO Home” button on the bottom PlatformIO Toolbar:

2. Click on “New Project”, select Nordic nRF52-DK as the development board, Zephyr RTOS as the framework and a path to the project location (or use the default one):
1. Create a new file `main.c` in `src_dir` folder and add the following code:

```c
// Copyright (c) 2015-2016 Intel Corporation
// SPDX-License-Identifier: Apache-2.0
#
#include <zephyr/types.h>
#include <stddef.h>
#include <sys/printk.h>
#include <sys/util.h>
#include <bluetooth/bluetooth.h>
#include <bluetooth/hci.h>
#define DEVICE_NAME CONFIG_BT_DEVICE_NAME
#define DEVICE_NAME_LEN (sizeof(DEVICE_NAME) - 1)

// Set Advertisement data. Based on the Eddystone specification:
// https://github.com/google/eddystone/blob/master/protocol-specification.md
```

(continues on next page)
// https://github.com/google/eddystone/tree/master/eddystone-url

```c
static const struct bt_data ad[] = {
    BT_DATA_FLAGS(BT_LE_AD_NO_BREDR),
    BT_DATA_UUID16_ALL(0xaa, 0xfe),
    BT_DATA_SVC_DATA16(0xaa, 0xfe, 0x10, // Eddystone-URL frame type
                       0x00, // Calibrated Tx power at 0m
                       0x00, // URL Scheme Prefix http://www.
                     'z', 'e', 'p', 'h', 'y', 'r',
                     'p', 'i', 'o', 'j', 'e', 'c', 't',
                     0x08) // .org
};

// Set Scan Response data
static const struct bt_data sd[] = {
    BT_DATA_NAME_COMPLETE(DEVICE_NAME, DEVICE_NAME_LEN),
};

static void bt_ready(int err)
{
    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
        return;
    }

    printk("Bluetooth initialized\n");

    // Start advertising
    err = bt_le_adv_start(BT_LE_ADV_NCONN, ad, ARRAY_SIZE(ad),
                          sd, ARRAY_SIZE(sd));
    if (err) {
        printk("Advertising failed to start (err %d)\n", err);
        return;
    }

    printk("Beacon started\n");
}

void main(void)
{
    int err;

    printk("Starting Beacon Demo\n");

    // Initialize the Bluetooth Subsystem
    err = bt_enable(bt_ready);
    if (err) {
        printk("Bluetooth init failed (err %d)\n", err);
    }
}
```

2. By default Bluetooth feature is disabled, we can enable it by creating a new file `prj.conf` in `zephyr` folder and adding the following lines:
CONFIG_BT=y
CONFIG_BT_DEBUG_LOG=y
CONFIG_BT_DEVICE_NAME="Test beacon"

Compiling and Uploading the Firmware

1. To compile the project use one of the following options:
   - Build option from the Project Tasks menu
   - Build button in PlatformIO Toolbar
   - Task Menu Tasks: Run Task... > PlatformIO: Build or in PlatformIO Toolbar
   - Command Palette View: Command Palette > PlatformIO: Build
   - Hotkeys cmd-alt-b / ctrl-alt-b:

2. If everything went well, we should see a successful result message in the terminal window:
3. To upload the firmware to the board we can use the following options:

- Upload option from the **Project Tasks** menu
- Upload button in **PlatformIO Toolbar**
- **Command Palette** View: Command Palette > PlatformIO: Upload
- **Task Menu** Tasks: Run Task... > PlatformIO: Upload
- **Hotkeys** cmd-alt-u / ctrl-alt-u:
4. Connect the board to your computer and update the default monitor speed to 115200 in `platformio.ini` file:

   ```ini
   [env:hifive1-revb]
   platform = sifive
   board = hifive1-revb
   framework = zephyr
   monitor_speed = 115200
   ```

5. Open Serial Monitor to observe the output from the board:
6. If everything went well, the board should be visible as a beacon:
Debugging the Firmware

Since Nordic nRF52-DK includes an onboard debug probe we can use *Debugging* without any configuration.

1. To start a debug session we can use the following options:
   - Debug: Start debugging from the top menu
   - Start Debugging option from Quick Access menu
   - Hotkey button F5:
2. We can walk through the code using control buttons, set breakpoints, add variables to Watch window.
Writing Unit Tests

Note: Functions `setUp` and `tearDown` are used to initialize and finalize test conditions. Implementations of these functions are not required for running tests but if you need to initialize some variables before you run a test, you use the `setUp` function and if you need to clean up variables you use `tearDown` function.

For the sake of simplicity, let’s create a small library called `calculator`, implement several basic functions `add`, `sub`, `mul`, `div` and test them using `Unit Testing` engine.

1. PlatformIO uses a unit testing framework called `Unity`. `Unity` is not compatible with C library implemented in the framework. Let’s enable standard version of newlib C library in `prj.conf` file using the following config:

   ```
   CONFIG_NEWLIB_LIBC=y
   ```

2. Create a new folder `calculator` in the `lib` folder and add two new files `calculator.h` and `calculator.c` with the following contents:

   ```
   calculator.h:
   
   #ifndef _CALCULATOR_H_
   #define _CALCULATOR_H_
   ```
#ifdef __cplusplus
extern "C" {
#endif

int add (int a, int b);
int sub (int a, int b);
int mul (int a, int b);
int div (int a, int b);

#ifdef __cplusplus
}
#endif

// _CALCULATOR_H_

calculator.c:

#include "calculator.h"

int add(int a, int b) {
    return a + b;
}

int sub(int a, int b) {
    return a - b;
}

int mul(int a, int b) {
    return a * b;
}

3. Create a new file `test_calc.c to the folder test and add basic tests for calculator library:

#include <calculator.h>
#include <unity.h>

void test_function_calculator_addition(void) {
    TEST_ASSERT_EQUAL(32, add(25, 7));
}

void test_function_calculator_subtraction(void) {
    TEST_ASSERT_EQUAL(20, sub(23, 3));
}

void test_function_calculator_multiplication(void) {
    TEST_ASSERT_EQUAL(50, mul(25, 2));
}

void test_function_calculator_division(void) {
    TEST_ASSERT_EQUAL(32, div(100, 3));
}

void main() {
    UNITY_BEGIN();

(continues on next page)
RUN_TEST(test_function_calculator_addition);
RUN_TEST(test_function_calculator_subtraction);
RUN_TEST(test_function_calculator_multiplication);
RUN_TEST(test_function_calculator_division);

UNITY_END();

4. Let’s run tests on the board and check the results. There should be a problem with `test_function_calculator_division` test:

![Screenshot of test results](image)

5. Let’s fix the incorrect expected value, run tests again. After processing the results should be correct:
Project Inspection

For illustrative purposes, let’s imagine we need to find a function with the biggest memory footprint. Also, let’s introduce a bug to our project so Static Code Analysis can report it.

1. **Open PlatformIO Home and navigate to Inspect section**, select the current project and press **Inspect** button:
2. Project statistics:
3. The biggest function:
4. Possible bugs:
Conclusion

Now we have a project template for Nordic Nordic nRF52-DK board that we can use as a boilerplate for the next projects.

RISC-V ASM Video Tutorial

An introduction to using SiFive and Assembly language on the SiFive HiFive1 by Martin Fink, Chief Technology Officer at Western Digital.

Source Files

A demo source code is published on Github: https://github.com/martin-robert-fink/superBlink.git

It is already pre-configured PlatformIO project:

- Clone it or download
- Open in VSCode
- Happy coding and debugging!
Video Collection

- Part 1 of 12 | Introduction
- Part 2 of 12 | Setting Up
- Part 3 of 12 | Tour PlatformIO
- Part 4 of 12 | C Code Wrapper
- Part 5 of 12 | HiFive Docs

1.6 “platformio.ini” (Project Configuration File)

Each PlatformIO project has a configuration file named platformio.ini in the root directory for the project. This is a INI-style file.

platformio.ini has sections (each denoted by a [header]) and key / value pairs within the sections. Lines beginning with ; are ignored and may be used to provide comments.

Multiple value options can be specified in two ways:

1. Split values with “,” (comma + space)
2. Multi-line format, where each new line starts with at least two spaces

There are two required sections:

- **PlatformIO Core (CLI) settings:** Section [platformio]
- **Environment settings:** Section [env]

The other sections are optional to include. Here are the allowed sections and their allowed contents:

1.6.1 Section [platformio]

- **Generic options**
  - description
  - default_envs
  - extra_configs
- **Directory options**
  - core_dir
  - globallib_dir
  - platforms_dir
The platform.ini platformio section is used for overriding the default configuration options for PlatformIO Core (CLI).

**Note:** Relative path is allowed for directory option:

- `~` will be expanded to user’s home directory
- `../` or `..\` go up to one folder

There is a `$PROJECT_HASH` template variable. You can use it in a directory path. It will be replaced by a SHA1[0:10] hash of the full project path. This is very useful to declare a global storage for project workspaces. For example, `/tmp/pio-workspaces/$PROJECT_HASH` (Unix) or `${sysenv.TEMP}/pio-workspaces/$PROJECT_HASH` (Windows). You can set a global workspace directory using the system environment variable `PLATFORMIO_WORKSPACE_DIR`.

See the available directory ***_dir options below.

### Generic options

#### description

Type: String | Multiple: No  
Short description of the project. PlatformIO uses it for PlatformIO Home in the multiple places.

#### default_envs

Type: String | Multiple: Yes  
The `pio run` command processes all environments `[env:***]` by default if the `pio run --environment` option is not specified. `default_envs` allows one to define which environments that should be processed by default.

Also, `Debugging` checks this option when looking for debug environment.
This option can also be configured by the global environment variable `PLATFORMIO_DEFAULT_ENVS`.

Example:

```
[platformio]
default_envs = uno, nodemcu

[env:uno]
platform = atmelavr
framework = arduino
board = uno

[env:nodemcu]
platform = espressif8266
framework = arduino
board = nodemcu

[env:teensy31]
platform = teensy
framework = arduino
board = teensy31

[env:lpmsp430g2553]
platform = timsp430
framework = arduino
board = lpmsp430g2553
build_flags = -D LED_BUILTIN=RED_LED
```

**extra_configs**

Type: String (Pattern) | Multiple: Yes

This option allows extending a base “`platformio.ini` (Project Configuration File)” with extra configuration files. The format and rules are the same as for the “`platformio.ini` (Project Configuration File). A name of the configuration file can be any.

`extra_configs` can be a single path to an extra configuration file or a list of them. Please note that you can use Unix shell-style wildcards:

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td>[seq]</td>
<td>matches any character in seq</td>
</tr>
<tr>
<td>![seq]</td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

**Note:** If you declare the same pair of “group” + “option” in an extra configuration file which was previously declared in a base “`platformio.ini` (Project Configuration File), it will be overwritten with a value from extra configuration.

**Example**

*Base “`platformio.ini`”*

```
[platformio]
extra_configs =
```
extra_envs.ini
extra_debug.ini

; Global data for all [env:***]
[env]
    platform = espressif32
    framework = espidf

; Custom data group
; can be use in [env:***] via ${common.***}
[common]
    debug_flags = -D RELEASE
    lib_flags = -lc -lm

[env:esp-wrover-kit]
    board = esp-wrover-kit
    build_flags = ${common.debug_flags}

"extra_envs.ini"

[env:esp32dev]
    board = esp32dev
    build_flags = ${common.lib_flags} ${common.debug_flags}

[env:lolin32]
    platform = espressif32
    framework = espidf
    board = lolin32
    build_flags = ${common.debug_flags}

"extra_debug.ini"

# Override base "common.debug_flags"
[common]
    debug_flags = -D DEBUG=1

[env:lolin32]
    build_flags = -Og

After a parsing process, configuration state will be the next:

[common]
    debug_flags = -D DEBUG=1
    lib_flags = -lc -lm

[env:esp-wrover-kit]
    platform = espressif32
    framework = espidf
    board = esp-wrover-kit
    build_flags = ${common.debug_flags}

[env:esp32dev]
    platform = espressif32
    framework = espidf
    board = esp32dev
    build_flags = ${common.lib_flags} ${common.debug_flags}
Directory options

core_dir

Type: DirPath | Multiple: No

The core_dir variable points out the directory used for all development platform packages (toolchains, frameworks, SDKs, upload and debug tools), global libraries for Library Dependency Finder (LDF), and other PlatformIO Core service data. The size of this folder will depend on the number of installed development platforms.

The default value is the user’s home directory:
- Unix ~/.platformio
- Windows %HOMEPATH%\platformio

This option can also be configured by the global environment variable PLATFORMIO_CORE_DIR.

Example:

```
[platformio]
core_dir = /path/to/custom/pio-core/storage
```

globallib_dir

Type: DirPath | Multiple: No | Default: “core_dir/lib”

Global library storage for PlatfrmIO projects and Library Management where Library Dependency Finder (LDF) looks for dependencies.

This option can also be configured by the global environment variable PLATFORMIO_GLOBALLIB_DIR.

platforms_dir

Type: DirPath | Multiple: No | Default: “core_dir/platforms”

Global storage where PlatformIO Package Manager installs Development Platforms.

This option can also be configured by the global environment variable PLATFORMIO_PLATFORMS_DIR.

packages_dir

Type: DirPath | Multiple: No | Default: “core_dir/packages”

Global storage where PlatformIO Package Manager installs Development Platforms dependencies (toolchains, Frameworks, SDKs, upload and debug tools).

This option can also be configured by the global environment variable PLATFORMIO_PACKAGES_DIR.
**cache_dir**

Type: DirPath | Multiple: No | Default: "core_dir/cache"

*PlatformIO Core (CLI)* uses this folder to store caching information (requests to PlatformIO Registry, downloaded packages and other service information).

To reset a cache, please run *pio update* command.

This option can also be configured by the global environment variable `PLATFORMIO_CACHE_DIR`.

**build_cache_dir**

Type: DirPath | Multiple: No | Default: None (Disabled)

*PlatformIO Core (CLI)* uses this folder to store derived files from a build system (objects, firmwares, ELFs). These files are shared between all build environments. To speed up a build process, you can use the same cache folder between different projects if they depend on the same development platform and framework.

This option can also be configured by the global environment variable `PLATFORMIO_BUILD_CACHE_DIR`.

The example of "platformio.ini" (Project Configuration File) below instructs PlatformIO Build System to check `build_cache_dir` for already compiled objects for *STM32Cube* and project source files. The cached object will not be used if the original source file was modified or build environment has a different configuration (new build flags, etc):

```
[platformio]
; Set a path to a cache folder
build_cache_dir =

; Examples:
; (Unix) build_cache_dir = /path/to/cache/folder
; (Windows) build_cache_dir = C:/path/to/cache/folder

[env:bluepill_f103c6]
platform = ststm32
framework = stm32cube
board = bluepill_f103c6

[env:nucleo_f411re]
platform = ststm32
framework = stm32cube
board = nucleo_f411re
```

**workspace_dir**

Type: DirPath | Multiple: No | Default: “Project/.pio”

The path to a project workspace directory where PlatformIO keeps by default compiled objects, static libraries, firmwares, and external library dependencies. It is used by these options:

- `build_dir`
- `libdeps_dir`

The default value is `.pio` and means that folder is located in the root of project.

This option can also be configured by the global environment variable `PLATFORMIO_WORKSPACE_DIR`. 
**build_dir**

**Warning:** PLEASE DO NOT EDIT FILES IN THIS FOLDER. PlatformIO will overwrite your changes on the next build. **THIS IS A CACHE DIRECTORY.**

Type: DirPath | Multiple: No | Default: “workspace_dir/build”

*PlatformIO Build System* uses this folder for project environments to store compiled object files, static libraries, firmwares and other cached information. It allows PlatformIO to build source code extremely fast!

You can delete this folder without any risk! If you modify “platformio.ini” (*Project Configuration File*), then PlatformIO will remove this folder automatically. It will be created on the next build operation.

This option can also be configured by the global environment variable `PLATFORMIO_BUILD_DIR`.

**Note:** If you have any problems with building your project environments which are defined in “platformio.ini” (*Project Configuration File*), then TRY TO DELETE this folder. In this situation you will remove all cached files without any risk. Also, you can use “clean” target for *pio run --target* command.

**libdeps_dir**

Type: DirPath | Multiple: No | Default: “workspace_dir/libdeps”

Internal storage where *Library Management* will install project dependencies (*lib_deps*).

This option can also be configured by the global environment variable `PLATFORMIO_LIBDEPS_DIR`.

**include_dir**

Type: DirPath | Multiple: No | Default: “Project/include”

The path to project’s default header files. PlatformIO uses it for the *pio run* command. The default value is include meaning an *include* directory located under the root directory of the project. This path will be added to CPPPATH of the build environment.

If you need to add extra include directories to CPPPATH scope, please use `build_flags` with `-I /path/to/extra/dir` option.

This option can also be configured by the global environment variable `PLATFORMIO_INCLUDE_DIR`.

**src_dir**

Type: DirPath | Multiple: No | Default: “Project/src”

The path to the project’s directory with source code. PlatformIO uses it for the *pio run* command. The default value is *src* meaning a *src* directory located in the root directory of the project.

This option can also be configured by the global environment variable `PLATFORMIO_SRC_DIR`.

**Note:** This option is useful for people who migrate from Arduino IDE where the source directory should have the same name as the main source file. See example project with own source directory.
**lib_dir**

Type: DirPath | Multiple: No | Default: “Project/lib”

You can put your own/private libraries here. The source code of each library should be placed in separate directory, like `lib/private_lib/ [here are source files]`. This directory has the highest priority for *Library Dependency Finder (LDF)*.

The default value is `lib`, meaning a `lib` directory located in the root of the project.

This option can also be configured by the global environment variable `PLATFORMIO_LIB_DIR`.

For example, see how the `Foo` and `Bar` libraries are organized:

```
|--lib
  | |--Bar
  |   | |--docs
  |   | |--examples
  |   | |--src
  |   |   |--Bar.c
  |   |   |--Bar.h
  |   |--Foo
  |     | |-- Foo.c
  |     | |-- Foo.h
  |     |-- platformio.ini
 |--src
     |-- main.c
```

Then in `src/main.c` you should use:

```c
#include <Foo.h>
#include <Bar.h>

// rest of H/C/CPP code
```

PlatformIO will find your libraries automatically, configure the preprocessor’s include paths and build them.

**data_dir**

Type: DirPath | Multiple: No | Default: “Project/data”

Data directory to store contents and *Using Filesystem*. The default value is `data` that means that folder is located in the root of the project.

This option can also be configured by the global environment variable `PLATFORMIO_DATA_DIR`.

**test_dir**

Type: DirPath | Multiple: No | Default: “Project/test”

The directory where *Unit Testing* engine will look for the tests. The default value is `test`, meaning a `test` directory located in the root of the project.

This option can also be configured by the global environment variable `PLATFORMIO_TEST_DIR`. 
boards_dir

Type: DirPath | Multiple: No | Default: “Project/boards”

The location of project-specific board definitions. Each project may choose a suitable directory name. The default value is boards, meaning a “boards” directory located in the root of the project.

By default, PlatformIO looks for boards in this order:

1. Project boards_dir (as defined by this setting)
2. Global core_dir/boards
3. Development platform core_dir/platforms/*/boards.

This option can also be configured by the global environment variable PLATFORMIO_BOARDS_DIR.

shared_dir

Type: DirPath | Multiple: No | Default: “Project/shared”

Remote Development uses this folder to synchronize extra files between remote machine. For example, you can share extra_scripts.

Please note that these folders are automatically shared between remote machine with pio remote run --force-remote or pio remote test --force-remote commands:

- lib_dir
- include_dir
- src_dir
- boards_dir
- data_dir
- test_dir

The default value is shared, meaning a directory named “shared” located in the root of the project.

This option can also be configured by the global environment variable PLATFORMIO_SHARED_DIR.

1.6.2 Section [env]

- Common [env]
- Environment [env:NAME]
- Options

Each project may have multiple configuration environments defining the available project tasks for building, programming, debugging, unit testing, device monitoring, library dependencies, etc. The configuration environments are declared using [env] sections in “platformio.ini” (Project Configuration File).

The allowed options are listed under Options.
Common [env]

An optional configuration environment with common options that will be shared between all [env:NAME] environments in the platform.ini file. It is very useful if the configuration file has a lot of environments [env:NAME] and they share common settings.

For example:

```
[env]
platform = ststm32
framework = stm32cube
board = nucleo_l152re
lib_deps = Dep1, Dep2

[env:release]
build_flags = -D RELEASE
lib_deps = ${env.lib_deps}
        Dep3

[env:debug]
build_type = debug
build_flags = -D DEBUG
lib_deps = DepCustom
```

In this example we have two configuration environments release and debug. This is equivalent to duplicating all options as shown below:

```
[env:release]
platform = ststm32
framework = stm32cube
board = nucleo_l152re
build_flags = -D RELEASE
lib_deps = Dep1, Dep2, Dep3

[env:debug]
platform = ststm32
framework = stm32cube
board = nucleo_l152re
build_type = debug
build_flags = -D DEBUG
lib_deps = DepCustom
```

Environment [env:NAME]

A section with an env: prefix defines a working environment for pio run, pio test, pio check, pio debug and other commands. Multiple [env:NAME] environments with different NAME are allowed. Every project must define at least one working environment.

Each environment must have a unique NAME. The valid chars for NAME are letters a-z, numbers 0-9, special char _ (underscore). For example, [env:hello_world].

If you have multiple working environments and you need to process only a few of them, the commands mentioned above accept the -e, --environment option to select a subset of the working environments to process. The [platformio] default_envs option can be used to define a default set of working environments for the commands to process.
Options

Platform options

- platform
- platform_packages
- framework
- board
- board_build.mcu
- board_build.f_cpu
- board_build.ldscript
- More options

platform

Type: String | Multiple: No

Development Platforms name.

PlatformIO allows one to use specific version of platform using Semantic Versioning (X.Y.Z=MAJOR.MINOR.PATCH) or VCS (Git, Mercurial and Subversion).

Version specifications can take any of the following forms:

- 1.2.3: an exact version number. Use only this exact version
- ^1.2.3: any compatible version (exact version for 1.x.x versions)
- ~1.2.3: any version with the same major and minor versions, and an equal or greater patch version
- >1.2.3: any version greater than 1.2.3. >=, <=, and <= are also possible
- >0.1.0, !=0.2.0, <0.3.0: any version greater than 0.1.0, not equal to 0.2.0 and less than 0.3.0

Examples:

[env:the_latest_version]
platform = atmelavr

[env:exact_version]
platform = atmelavr@1.2.3

[env:specific_major_version]
platform = atmelavr@^1.2.3

[env:specific_major_and_minor_version]
platform = atmelavr@~1.2.3

[env:development_version_by_git]
platform = https://github.com/platformio/platform-ststm32.git

(continues on next page)
platform_packages

Type: String | Multiple: Yes

Configure custom packages per a build environment. You can also override default packages by Development Platforms using the same name. Packages will be installed in packages_dir.

Examples:

```python
[env:override_default_toolchain]
platform = atmelavr
platform_packages =
  ; use GCC AVR 5.0+
  toolchain-gccarmnoneeabi@1.50000.0

[env:override_framework]
platform = espressif8266
platform_packages =
  ; use upstream Git version
  framework-arduinoespressif8266 @ https://github.com/esp8266/Arduino.git

[env:external_package]
platform = ststm32
platform_packages =
  ; latest openOCD from PlatformIO Package Registry
  tool-openocd
  ; source code of ST-Link
  tool-stlink-source @ https://github.com/texane/stlink.git
```

framework

Type: String | Multiple: Yes

Frameworks name.

board

Type: String (ID) | Multiple: No

PlatformIO has pre-configured settings for the most popular boards:

- build configuration
- upload configuration
- debugging configuration
**connectivity information, etc.**

You can find a valid `board` ID in *Boards* catalog, *Boards Explorer* or *pio boards* command.

**board_build.mcu**

**Type: String | Multiple: No**

`board_build.mcu` is a microcontroller(MCU) type that is used by compiler to recognize MCU architecture. The correct type of `board_build.mcu` depends on platform library. For example, the list of `board_build.mcu` for “megaAVR Devices” is described here.

The full list of `board_build.mcu` for the popular embedded platforms you can find in *Boards* section of *Development Platforms*. See “Microcontroller” column.

**board_build.f_cpu**

**Type: Integer | Multiple: No**

The option `board_build.f_cpu` is used to define MCU frequency (Hertz, Clock). A format of this option is C-like long integer value with `L` suffix. The 1 Hertz is equal to `1L`, then 16 MHz (Mega Hertz) is equal to `16000000L`.

The full list of `board_build.f_cpu` for the popular embedded platforms you can find in *Boards* section of *Development Platforms*. See “Frequency” column. You can overclock a board by specifying a `board_build.f_cpu` value other than the default.

**board_build.ldscript**

**Type: String | Multiple: No**

Path to the linker script to be used instead of the one defined by a framework. This is useful for specifying a modified linker script, for example, when an application requires a special memory section for a bootloader.

**More options**

You can override any board option declared in manifest file using the next format `board_{OBJECT.PATH}`, where `{OBJECT.PATH}` is an object path in JSON manifest. Please navigate to “boards” folder of PlatformIO development platforms and open JSON file to list all available options.

For example, Manifest: Espressif ESP32 Dev Module:

```
[env:custom_board_options]
; Custom CPU Frequency
board_build.f_cpu = 160000000L

; Custom FLASH Frequency
board_build.f_flash = 80000000L

; Custom FLASH Mode
board_build.flash_mode = qio

; Custom linker script
board_build.ldscript = /path/to/ldscript.ld
```

(continues on next page)
Build options

- **build_type**
- **build_flags**
  - *Built-in Variables*
  - *Dynamic build flags*
- **src_build_flags**
- **build_unflags**
- **src_filter**
- **targets**

**build_type**

Type: String | Multiple: No | Default: release

See extended documentation for *Build Configurations*.

**build_flags**

Type: String | Multiple: Yes

These flags/options affect the preprocessing, compilation, assembly and linking processes for C and C++ code. All compiler and linker flags can be used. Here is a list of some common options.

In spite of the name, **CPPDEFINES** rows also applies to the C compiler.
### Format

<table>
<thead>
<tr>
<th>Format</th>
<th>Affects build variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-D name</code></td>
<td>CPPDE-FINES</td>
<td>Predefine <code>name</code> as a macro, with definition 1.</td>
</tr>
<tr>
<td><code>-D name=definition</code></td>
<td>CPPDE-FINES</td>
<td>The contents of <code>definition</code> are tokenized and processed as if they appeared during translation phase three in a <code>#define</code> directive.</td>
</tr>
<tr>
<td><code>-U name</code></td>
<td>CPPDE-FINES</td>
<td>Cancel any previous definition of <code>name</code>, either built in or provided with a <code>-D</code> option.</td>
</tr>
<tr>
<td><code>-Wp,option</code></td>
<td>CPPFLAGS</td>
<td>Bypass the compiler driver and pass <code>option</code> directly through to the preprocessor.</td>
</tr>
<tr>
<td><code>-Wall</code></td>
<td>CCFLAGS</td>
<td>Turn on all optional warnings which are desirable for normal code.</td>
</tr>
<tr>
<td><code>-Werror</code></td>
<td>CCFLAGS</td>
<td>Make all warnings into hard errors. With this option, if any source code triggers warnings, the compilation will be aborted.</td>
</tr>
<tr>
<td><code>-w</code></td>
<td>CCFLAGS</td>
<td>Suppress all warnings, including those which GNU CPP issues by default.</td>
</tr>
<tr>
<td><code>-include file</code></td>
<td>CCFLAGS</td>
<td>Process <code>file</code> as if <code>#include &quot;file&quot;</code> appeared as the first line of the primary source file.</td>
</tr>
<tr>
<td><code>-Idir</code></td>
<td>CPPPATH</td>
<td>Add the directory <code>dir</code> to the list of directories to be searched for header files.</td>
</tr>
<tr>
<td><code>-Wa,option</code></td>
<td>ASFLAGS, CCFLAGS</td>
<td>Pass <code>option</code> as an option to the assembler. If <code>option</code> contains commas, it is split into multiple options at the commas.</td>
</tr>
<tr>
<td><code>-Wl,option</code></td>
<td>LINKFLAGS</td>
<td>Pass <code>option</code> as an option to the linker. If <code>option</code> contains commas, it is split into multiple options at the comma.</td>
</tr>
<tr>
<td><code>-llibrary</code></td>
<td>LIBS</td>
<td>Search the <code>library</code> named library when linking</td>
</tr>
<tr>
<td><code>-Ldir</code></td>
<td>LIBPATH</td>
<td>Add directory <code>dir</code> to the list of directories to be searched for <code>-l</code>.</td>
</tr>
</tbody>
</table>

This option can also be set by global environment variable `PLATFORMIO_BUILD_FLAGS`.

For more detailed information about available flags/options go to:

- Options to Request or Suppress Warnings
- Options for Debugging Your Program
- Options That Control Optimization
- Options Controlling the Preprocessor
- Passing Options to the Assembler
- Options for Linking
- Options for Directory Search

Examples:

```yaml
[env:specific_defines]
build_flags =
  -DFOO -DBAR=1
  -D BUILD_ENV_NAME=$PIOENV
  -D CURRENT_TIME=$UNIX_TIME
  -DFLOAT_VALUE=1.23457e+07

[env:string_defines]
build_flags =
  -DHELLO="World!"
  '-DWIFI_PASS="My password"
  ; Password with special chars: My pass\'word
  -DWIFI_PASS="\My\ pass\'word\"
```

(continues on next page)
[env:specific_inclibs]
build_flags =
  -I/opt/include
  -L/opt/lib
  -lfoo

[env:ignore_incremental_builds]
; We dynamically change the value of "LAST_BUILD_TIME" macro,
; PlatformIO will not cache objects
build_flags = -DLAST_BUILD_TIME=$UNIX_TIME

Note: If you need to control build flags that are specific for debug configuration please refer to debug_build_flags.

Built-in Variables

You can inject the built-in variables into your build flags, such as:

- $PYTHONEXE, full path to current Python interpreter
- $UNIX_TIME, current time in Unix format
- $PIOENV, name of build environment from “platformio.ini” (Project Configuration File)
- $PIOPLATFORM, name of development platform
- $PIOFRAMEWORK, a list of frameworks
- $PROJECT_DIR, project directory
- $PROJECT_CORE_DIR, PlatformIO Core directory, see core_dir
- $PROJECT_BUILD_DIR, project build directory per all environments
- $BUILD_DIR, build directory per current environment

See the full list of PlatformIO variables.

Please use target envdump for the pio run --target command to see ALL variable values for a build environment.

Dynamic build flags

PlatformIO allows users to run an external command/script which outputs build flags into STDOUT by prepending the shell command with a ! character. PlatformIO will automatically replace commands with their output when appending flags to build environments.

You can use any shell or programming language.

This external command will be called on each pio run command before building/uploading process.

Use cases:

- Macro with the latest VCS revision/tag “on-the-fly”
- Generate dynamic headers (*.h)
- Process media content before generating SPIFFS image
- Make some changes to source code or related libraries
Note: If you need more advanced control and would like to apply changes to a PlatformIO Build System environment, please refer to Advanced Scripting.

Example:

```ini
[env:generate_flags_with_external_command]
build_flags = !cmd_or_path_to_script

; Unix only, get output from internal command
build_flags = !echo "-DSOME_MACRO=$(some_cmd arg1 --option1)"
```

Use Case: Create a “PIO_SRC_REV” macro with the latest Git revision

This example includes a separate file named `git_rev_macro.py`, to be placed in the same directory as `platformio.ini`.

`platformio.ini`:

```ini
[env:git_revision_macro]
build_flags = !python git_rev_macro.py
```

`git_rev_macro.py`:

```python
import subprocess

revision = 
    subprocess.check_output(['git', 'rev-parse', 'HEAD'])
    .strip()
    .decode('utf-8')

print("-DGIT_REV='\"%s\'\"" % revision)
```

**src_build_flags**

Type: String | Multiple: Yes

An option `src_build_flags` has the same behavior as `build_flags` but will be applied only for project source files in the `src_dir` directory.

This option can also be set by the global environment variable `PLATFORMIO_SRC_BUILD_FLAGS`.

**build_unflags**

Type: String | Multiple: Yes

Selectively remove base/initial flags that were set by the development platform.

```ini
[env:unflags]
build_unflags = -Os -std=gnu++11
build_flags = -O2
```

**src_filter**

Type: String (Templates) | Multiple: Yes
This option allows one to specify which source files should be included or excluded from `src_dir` for a build process. Filter supports two templates:

- `+<PATH>` include template
- `-<PATH>` exclude template

`PATH` is relative to `src_dir`. All patterns will be applied in their order of definition. GLOB Patterns are allowed.

By default, `src_filter` is predefined to `+<*> -<.git/> -<.svn/> -<example/> -<examples/> -<test/> -<tests/>`, meaning “include ALL files, then exclude the .git and svn repository folders and the example... folder.

This option can also be set by the global environment variable `PLATFORMIO_SRC_FILTER`.

### targets

**Type:** String | **Multiple:** Yes

A list of targets which will be processed by the `pio run` command by default. You can enter more than one target, if separated by comma+space “,”.

Please follow to `pio run --list-targets` documentation for the other targets.

**Examples**

1. Build a project using Release Configuration, upload the firmware, and start Serial Monitor automatically:

   ```
   [env:upload_and_monitor]
   targets = upload, monitor
   ```

2. Build a project using Debug Configuration.

**Tip!** You can use these targets like an option to `pio run --target` command. For example:

   ```
   # clean project
   pio run -t clean
   # dump current build environment
   pio run --target envdump
   ```

When no targets are defined, PlatformIO will build only sources by default.

### Library options

**See also:**

Please make sure to read Library Dependency Finder (LDF) guide first.

- `lib_deps`
- `lib_ignore`
- `lib_extra_dirs`
- `lib_ldf_mode`
- `lib_compat_mode`
lib_deps

See also:
Please make sure to read Library Dependency Finder (LDF) guide first.

Type: String | Multiple: Yes

Specify project dependencies that should be installed automatically to `libdeps_dir` before environment processing.

If you have multiple build environments that depend on the same libraries, you can use Dynamic variables to use common configuration.

Valid forms

```
[env:myenv]
lib_deps = LIBRARY_1, LIBRARY_2, LIBRARY_N

[env:myenv2]
lib_deps =
  LIBRARY_1
  LIBRARY_2
  LIBRARY_N
```

The each line with `LIBRARY_1`... `LIBRARY_N` will be passed automatically to `pio lib install` command.

Please check `pio lib install` for the valid declaration formats.

Example:

```
[env:myenv]
lib_deps =

; name-based (built-in library in framework)
SPI

; owner-based declaration
knolleary/PubSubClient

; SemVer specification
bblanchon/ArduinoJson @ ^5.6,!=5.4

; external Git resource
https://github.com/gioblu/PJON.git#v2.0

; custom name
IRremoteESP8266=https://github.com/markszabo/IRremoteESP8266/archive/master.zip
```

lib_ignore

See also:
Please make sure to read Library Dependency Finder (LDF) guide first.

Type: String | Multiple: Yes
Specify libraries which should be ignored by Library Dependency Finder.

The correct value for this option is a library name (not folder name). You will see these names in “Library Dependency Graph” when building a project between < and > symbols.

**Example:**

```
Build output
...
LDF MODES: FINDER(chain+) COMPATIBILITY(soft)
Collected 54 compatible libraries
Scanning dependencies...
Dependency Graph
|-- <Hash> v1.0
  |-- <AsyncMqttClient> v0.8.2
  |-- <ESPAsyncTCP> v1.1.3
  |-- <ESP8266WiFi> v1.0
  |-- <ESP Async WebServer> v1.1.1
  |  |-- <ESPAsyncTCP> v1.1.3
  |  |-- <ESP8266WiFi> v1.0
  |  |-- <Hash> v1.0
  |  |-- <ArduinoJson> v5.13.1
  |  |-- <ESP8266WiFi> v5.13.1
  |  |-- <DNSServer> v1.1.0
  |  |-- <Ticker> v1.0
  |-- <Ticker> v1.0
....
```

`platformio.ini`

```
[env:myenv]
; Single line
lib_ignore = AsyncMqttClient, DNSServer

; Multi-line
lib_ignore =
  AsyncMqttClient
  ESP Async WebServer
```

**lib_extra_dirs**

See also:

Please make sure to read *Library Dependency Finder (LDF)* guide first.

Type: DirPath | Multiple: Yes

A list with extra directories/storages where *Library Dependency Finder (LDF)* will look for dependencies.

This option can also be set by global environment variable `PLATFORMIO_LIB_EXTRA_DIRS`.

**Warning:** This is a not direct path to a library with source code. It should be a path to storage that contains libraries grouped by folders. For example, `D:\PlatformIO\extra\libraries` but not `D:\PlatformIO\extra\libraries\FooLibrary`. 
Example:

```
[env:myenv]
lib_extra_dirs =
   /common/libraries
   /iot/libraries
```

**lib_ldf_mode**

See also:

Please make sure to read *Library Dependency Finder (LDF)* guide first.

Type: String | Multiple: No | Default: chain

This option specifies how does Library Dependency Finder should analyze dependencies (#include directives). See *Dependency Finder Mode* for details and available options.

Example:

```
[env:myenv]
; evaluate C/C++ Preprocessor conditional syntax
lib_ldf_mode = chain+
```

**lib_compat_mode**

See also:

Please make sure to read *Library Dependency Finder (LDF)* guide first.

Type: String | Multiple: No | Default: soft

Library compatibility mode allows one to control strictness of Library Dependency Finder. See *Compatibility Mode* for details and available options.

By default, this value is set to `lib_compat_mode = soft` and means that LDF will check only for framework compatibility.

Example:

```
[env:myenv]
; Checks for the compatibility with frameworks and dev/platforms
lib_compat_mode = strict
```

**lib_archive**

Type: Bool (yes or no) | Multiple: No | Default: yes

Create an archive (*.a, static library) from the object files and link it into a firmware (program). This is default behavior of PlatformIO Build System (`lib_archive = yes`).

Setting `lib_archive = no` will instruct PlatformIO Build System to link object files directly (in-line). This could be useful if you need to override weak symbols defined in framework or other libraries.

You can disable library archiving per a custom library using `libArchive` field in `library.json` manifest.

Example:
**Upload options**

- **upload_port**
- **upload_protocol**
- **upload_speed**
- **upload_flags**
- **upload_resetmethod**
- **upload_command**

**upload_port**

Type: String (Pattern) | Multiple: No

This option is used by "uploader" tool when sending firmware to board via `upload_port`. For example,

- `/dev/ttyUSB0` - Serial port (Unix-based OS)
- `COM3` - Serial port (Windows OS)
- `192.168.0.13` - IP address when using OTA
- `/media/disk` - physical path to media disk/flash drive (*Mbed* enabled boards)
- `D:` - physical path to media disk/flash drive (Windows OS).

If `upload_port` isn’t specified, then *PlatformIO* will try to detect it automatically.

To print all available serial ports please use `pio device list` command.

This option can also be set by global environment variable `PLATFORMIO_UPLOAD_PORT`.

Please note that you can use Unix shell-style wildcards:

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td><code>[seq]</code></td>
<td>matches any character in seq</td>
</tr>
<tr>
<td><code>[^seq]</code></td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

**Example**

```plaintext
[env:uno]
platform = atmelavr
framework = arduino

; any port that starts with /dev/ttyUSB
upload_port = /dev/ttyUSB*
```
upload_port

Type: String | Multiple: No

A protocol that “uploader” tool uses to talk to a board. Please check Boards for supported uploading protocols by your board.

Note: upload_protocol = custom allows one to use a custom upload_command - see below.

upload_speed

Type: Integer | Multiple: No

A connection speed (baud rate) which “uploader” tool uses when sending firmware to board.

upload_flags

Type: String | Multiple: Yes

Extra flags for uploader. Will be added to the end of uploader command. If you need to override uploader command or base flags please use extra_scripts.

This option can also be set by global environment variable PLATFORMIO_UPLOAD_FLAGS.

Example

Please specify each flag/option in a new line starting with minimum 2 spaces.

```ini
[env:atmega328pb]
platform = atmelavr
board = atmega328pb
framework = arduino
upload_flags =
    -P$UPLOAD_PORT
    -b$UPLOAD_SPEED
    -u
    -Ulock:w:0xCF:m
    -Uhfuse:w:0xD7:m
    -Uefuse:w:0xF6:m
    -Ulfuse:w:0xE2:m
```

upload_ResetMethod

Type: String | Multiple: No

Specify reset method for “uploader” tool. This option isn’t available for all development platforms. The only Espressif 8266 supports it.
**upload_command**

Type: String | Multiple: No

Override default `Development Platforms` upload command with a custom command. You can pass a full upload
command with arguments and options or mix with `upload_flags`.

In order to use `upload_command`, `upload_protocol = custom` must be specified.

Default upload commands are declared in `build/main.py` script file of `Development Platforms`. See a list with
open source `Development Platforms` => https://github.com/topics/platformio-platform

**Note:** Please note that you can use build variables in `upload_command`, such as PlatformIO project folders and
other runtime configuration. A list with build variables are available by running `pio run --target envdump` command.

**Examples**

1. Override default upload command but handle pre-uploading actions (looking for serial port, extra image prepara-
tion, etc.). Normally, the pre-configured upload options will be stored in `$UPLOADERFLAGS` build vari-
able. A classic default upload command for `Development Platforms` may look as `some-flash-bin-tool
$UPLOADERFLAGS $SOURCE`, where `$SOURCE` will be replaced by a real program/firmware binary.

```
$PROJECT_PACKAGES_DIR` build variable points to `packages_dir`
```

```
[env:program_via_AVR_ISP]
platform = atmelavr
framework = arduino
board = uno
upload_protocol = custom
upload_flags =
  -C
  $PROJECT_PACKAGES_DIR/tool-avrdude/avrdude.conf
  -p
  atmega328p
  -P $UPLOAD_PORT
  -b
  115200
  -c
  stk500v1
upload_command = avrdude $UPLOAD_FLAGS -U flash:w:$SOURCE:i
```

2. Override default upload command and skip pre-uploading actions.

```
[env:program_via_usbasp]
platform = atmelavr
framework = arduino
board = uno
upload_protocol = custom
upload_flags =
  -C
  $PROJECT_PACKAGES_DIR/tool-avrdude/avrdude.conf
  -p
  atmega328p
  -Pusb
  -c
```
(continues on next page)
stk500v1
upload_command = avrdude $UPLOAD_FLAGS -U flash:w:$SOURCE:i

; Use ST-util for flashing
; https://github.com/texane/stlink

[env:custom_st_flash]
platform = ststm32
framework = stm32cube
board = bluepill_f103c6
upload_protocol = custom
upload_command = →$
PROJECT_PACKAGES_DIR/tool-stlink/st-flash write $SOURCE 0x8000000

Monitor options

- monitor_port
- monitor_speed
- monitor_filters
- monitor_rts
- monitor_dtr
- monitor_flags

Custom options for pio device monitor command.

monitor_port

Type: String | Multiple: No

Port, a number or a device name, or valid URL Handlers. See pio device monitor --port. To print all available serial ports please use pio device list command.

Please note that you can use Unix shell-style wildcards:

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td>[seq]</td>
<td>matches any character in seq</td>
</tr>
<tr>
<td>[!seq]</td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

Example:

[env:custom_monitor_port]
...
; Unix
monitor_port = /dev/ttyUSB1

(continues on next page)
monitor_port  =  COM[13]

; Socket
monitor_port  =  socket://localhost:4444

**monitor_speed**

Type: Integer | Multiple: No | Default: 9600

A monitor speed (baud rate). See `pio device monitor --baud`.

Example:

```
[env:custom_monitor_speedrate]
...
monitor_speed  =  115200
```

**monitor_filters**

Type: String | Multiple: Yes

Apply filters and text transformation for device output. See available filters at `Filters`.

Example:

```
[env:log_output_to_file_with_timestamp]
...
platform  =  ...
monitor_filters  =  log2file, time, default
```

**monitor_rts**

Type: Integer (0 or 1) | Multiple: No

A monitor initial RTS line state. See `pio device monitor --rts`.

**monitor_dtr**

Type: Integer (0 or 1) | Multiple: No

A monitor initial DTR line state. See `pio device monitor --dtr`.

**monitor_flags**

Type: String | Multiple: Yes

Pass extra flags and options to `pio device monitor` command. Please note that each flag, option or its value should be passed in a new line. See example below.

Available flags and options are the same which are documented for `pio device monitor` command.
Example:

```ini
[env:extra_monitor_flags]
platform = ...
board = ...
monitor_flags=
    --parity
    N
    --encoding
    hexlify
```

**Check options**

See also:

Please make sure to read *Static Code Analysis* guide first.

- `check_tool`
- `check_patterns`
- `check_flags`
- `check_severity`

**check_tool**

**Type:** String | **Multiple:** Yes | **Default:** cppcheck

A name of the check tool used for analysis. This option is useful when you want to check source code with two or more tools.

See available tools in *Check tools*.

**Example**

```ini
[env:myenv]
platform = ...
board = ...
check_tool = cppcheck, clangtidy
```

**check_patterns**

**Type:** String (Pattern) | **Multiple:** Yes

This option allows specifying which source files or folders should be included/excluded from the check process. GLOB Patterns are allowed. `src_dir` and `include_dir` folders are checked by default.

Another option for filtering source files is `pio check --pattern` command.

**Example**

```ini
[env:myenv]
platform = ...
board = ...
check_patterns
```
[env:custom_check_patterns]
platform = ...
board = ...
check_tool = clangtidy
check_patterns =
   app/sources
   tests/hardware/*.c

check_flags

Type: String | Multiple: Yes

Additional flags to be passed to the tool command line. This option is useful when you want to adjust the check process to fit your project requirements. By default, the flags are passed to all tools specified in `check_tool` section. To set individual flags, define tool name at the beginning of the line.

Another option for adding flags is `pio check --flags` command.

Example

[env:extra_check_flags]
platform = ...
board = ...
check_tool = cppcheck, clangtidy
check_flags =
   --common-flag
   cppcheck: --enable=performance --inline-suppr
   clangtidy: -fix-errors -format-style=mozilla

check_severity

Type: String | Multiple: Yes | Default: low, medium, high

This option allows specifying the Defect severity types which will be reported by the Check tools.

Another option for filtering source files is `pio check --severity` command.

Example

[env:detect_only_medium_or_high_defects]
platform = ...
board = ...
check_severity = medium, high

Test options

See also:

Please make sure to read `Unit Testing` guide first.

- test_filter
- test_ignore
test_port

• test_port
• test_speed
• test_transport
• test_build_project_src

---

test_filter

Type: String (Pattern) | Multiple: Yes

Process only the *Unit Testing* tests where the name matches specified patterns.
Also, you can filter some tests using `pio test --filter` command.

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td>[seq]</td>
<td>matches any character in seq</td>
</tr>
<tr>
<td>![seq]</td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

Example

```plaintext
[env:myenv]
test_filter = footest, bartest_*, test[13]
```

test_ignore

Type: String (Pattern) | Multiple: Yes

Ignore *Unit Testing* tests where the name matches specified patterns.
Also, you can ignore some tests using `pio test --ignore` command.

<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td>[seq]</td>
<td>matches any character in seq</td>
</tr>
<tr>
<td>![seq]</td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

Example

```plaintext
[env:myenv]
test_ignore = footest
             bartest_*
             test[13]
```

test_port

Type: String (Pattern) | Multiple: No
This option specifies communication interface (Serial/UART) between PlatformIO Unit Testing Engine and target device. For example,

- /dev/ttyUSB0 - Unix-based OS
- COM3 - Windows OS

If test_port isn’t specified, then PlatformIO will try to detect it automatically.

To print all available serial ports use pio device list command.

**test_speed**

Type: Integer | Multiple: No | Default: 115200

A connection speed (baud rate) to communicate with a target device.

**test_transport**

Type: String | Multiple: No

A transport type which will be used to read test results from a target device. See more details at Test Transport.

**test_build_project_src**

Type: Bool {yes or no} | Multiple: No | Default: no

Force Unit Testing engine to build project source code from src_dir setting test_build_project_src to yes. More detail about Shared Code.

**Example**

```
[env:myenv]
platform = ...

test_build_project_src = yes
```

**Debugging options**

See also:

Please make sure to read Debugging guide first.
debug_tool

Type: String | Multiple: No
A name of debugging tool. This option is useful when board supports more than one debugging tool (adapter, probe) or you want to create Custom debugging configuration.

See available tools in Tools & Debug Probes.

Example

```ini
[env:debug]
platform = ...
board = ...
debug_tool = custom
```

debug_build_flags

Type: String | Multiple: Yes | Default: -Og -g2 -ggdb2
These flags/options affect the preprocessing, compilation, assembly and linking processes for C and C++ code.

Note: This option might be helpful to adjust the optimization level if firmware with debug information is too big to be uploaded to a target

Example

```ini
[env:debug]
platform = ...
board = ...

; Set optimization level and amount of debug information generated by the compiler
debug_build_flags = -O0 -ggdb3 -g3
```

Other possible flags that might be useful for debugging your application.

debug_init_break

Type: String | Multiple: No | Default: tbreak main
An initial breakpoint that makes your program stop whenever a certain point in the program is reached. Default value is set to tbreak main and means creating a temporary breakpoint at int main(...) function and automatically delete it after the first time a program stops there.

• GDB Setting Breakpoints
• GDB Breakpoint Locations
Note: Please note that each debugging tool (adapter, probe) has limited number of hardware breakpoints. If you need more Project Initial Breakpoints, please place them in debug_extra_cmds.

Examples

```yaml
[env:debug]
platform = ...
board = ...

debug_init_break =

; Examples 1: disable initial breakpoint
debug_init_break =

; Examples 2: temporary stop at `void loop()`` function
debug_init_break = tbreak loop

; Examples 3: stop in main.cpp at line 13
debug_init_break = break main.cpp:13

; Examples 4: temporary stop at `void Reset_Handler(void)`
debug_init_break = tbreak Reset_Handler
```

debug_init_cmds

Type: String | Multiple: Yes | Default: See details...

Initial commands that will be passed to back-end debugger.

PlatformIO dynamically configures back-end debugger depending on a debug environment. Here is a list with default initial commands for the popular Tools & Debug Probes.

For example, the custom initial commands for GDB:

```yaml
[env:debug]
platform = ...
board = ...
debug_init_cmds =
    target extended-remote $DEBUG_PORT
    $INIT_BREAK
    monitor reset halt
    $LOAD_CMDS
    monitor init
    monitor reset halt
```

debug_extra_cmds

Type: String | Multiple: Yes

Extra commands that will be passed to back-end debugger after debug_init_cmds. For example, add custom breakpoint and load .gdbinit from a project directory for GDB:

```yaml
[env:debug]
platform = ...
board = ...
```
debug_extra_cmds =
    break main.cpp:13
    break foo.cpp:100
    source .gdbinit

Note: Initial Project Breakpoints: Use `break path/to/file:LINE_NUMBER` to define initial breakpoints for debug environment. Multiple breakpoints are allowed.

To save session breakpoints, please use `save breakpoints [filename]` command in Debug Console. For example, `save breakpoints .gdbinit`. Later, this file could be loaded via `source [filename]` command. See above.

debug_load_cmds

Type: String | Multiple: Yes | Default: load

Specify a command which will be used to load program/firmware to a target device. Possible options:

- **load - default** option
- **load [address]** - load program at specified address, where “[address]” should be a valid number
- **preload** - some embedded devices have locked Flash Memory (a few Freescale Kinetis and NXP LPC boards). In this case, firmware loading using debugging client is disabled. `preload` command instructs PlatformIO Core (CLI) to load program/firmware using development platform “upload” method (via bootloader, media disk, etc)
- (empty value, `debug_load_cmds =`), disables program loading at all.
- **custom commands** - pass any debugging client command (GDB, etc.)

Sometimes you need to run extra monitor commands (on debug server side) before program/firmware loading, such as flash unlocking or erasing. In this case we can combine service commands with loading and run them before. See example:

```ini
[env:debug]
platform = ...
board = ...
debug_load_cmds =
    monitor flash erase_sector 0 0 11
    load
```

debug_load_mode

Type: String | Multiple: No | Default: always

Allows one to control when PlatformIO should load debugging firmware to the end target. Possible options:

- **always** - load for the each debugging session, **default**
- **modified** - load only when firmware was modified
- **manual** - do not load firmware automatically. You are responsible to pre-flash target with debugging firmware in this case.

1.6. “platformio.ini” (Project Configuration File) 287
debug_server

Type: String | Multiple: Yes

Allows one to setup a custom debugging server. By default, boards are pre-configured with a debugging server that is compatible with “on-board” debugging tool (adapter, probe). Also, this option is useful for a Custom debugging tool.

Option format (multi-line):

- First line is an executable path of debugging server
- 2-nd and the next lines are arguments for executable file

Example:

```plaintext
[env:debug]
platform = ...
board = ...
debug_server = /path/to/debugging/server
arg1
arg2
...
argN
```

debug_port

Type: String | Multiple: No

A debugging port of a remote target. Could be a serial device or network address. PlatformIO detects it automatically if is not specified.

For example:

- /dev/ttyUSB0 - Unix-based OS
- COM3 - Windows OS
- localhost:3333

debug_svd_path

Type: FilePath | Multiple: No

A custom path to SVD file which contains information about device peripherals.

Advanced options

extends

Type: String | Multiple: Yes

This option allows one to inherit configuration from other sections or build environments in “platformio.ini” (Project Configuration File). Multiple items are allowed, split them with , or with a new line.

If you need to extend only a few options from some section, please take a look at Dynamic variables.

Example:
extra_scripts

Type: FilePath | Multiple: Yes

A list of PRE and POST extra scripts.

See details and examples in Advanced Scripting section.

If you plan to share these scripts with Remote Development machine, please put them to shared_dir.

1.6.3 Build Configurations

There are 2 types (build_type) of build configuration in PlatformIO:

release Default configuration. A “release” configuration of your firmware/program does not contain symbolic debug information and is optimized for the firmware size or speed (depending on Development Platforms)

debug A “debug” configuration of your firmware/program is compiled with full symbolic debug information and no optimization. Optimization complicates debugging, because the relationship between source code and generated instructions is more complex.

Note: If you need to control build flags that are specific for debug configuration please refer to debug_build_flags.

If you need to build a project in debug configuration, please use one of these options:

- Add build_type with debug value to “platformio.ini” (Project Configuration File)
- Use target debug for the pio run --target command.

Note: Debugging automatically switches to debug configuration when you do project debugging from PlatformIO IDE or use the pio debug command.

To avoid having Debugging rebuild the project, please create a separate build environment that defines build_type = debug. See the example below where the mydebug build environment will be used automatically by Debugging:
Please note that you can set a default build environment per a project using the *default_envs* option in Section [platformio].

### 1.6.4 Dynamic variables

Dynamic variables (interpolations) are useful when you have a custom configuration data between build environments. For examples, extra *build_flags* or project dependencies *lib_deps*.

Each variable should have a next format: `@{<section>.<option>}`, where `<section>` is a value from `[@<section>]` group, and `<option>` is a first item from pair `<option> = value`.

You can inject system environment variable using *sysenv* as a section. For example, `@{sysenv.HOME}`.

- Variable can be applied only for the option’s value
- Multiple variables are allowed
- The Section [platformio] and Section [env] sections are reserved and could not be used as a custom section. Some good section names might be *extra* or *custom*.

**Note:** If you need to share common configuration options between build environments, please take a look at “Global scope” in Section [env] or *extends* option which allows extending of other sections.

Example:

```plaintext
; You MUST inject these options into [env:] section
; using ${extra.***} (see below)
[extra]
build_flags = -D VERSION=1.2.3 -D DEBUG=1
lib_deps_builtin =
  SPI
  Wire
lib_deps_external =
  bblanchon/ArduinoJson@>5.6.0

[env:uno]
platform = atmelavr
framework = arduino
board = uno
build_flags = ${extra.build_flags}
lib_deps =
  ${extra.lib_deps_builtin}
```

(continues on next page)
```ini
[env:nodemcuv2]
platform = espressif8266
framework = arduino
board = nodemcuv2
build_flags = ${extra.build_flags} -Wall
lib_deps =
    ${extra.lib_deps_builtin}
    ${extra.lib_deps_external}
    knolleary/PubSubClient @ ~2.6
    paulstoffregen/OneWire @ ^2.3.5

; Keep sensitive data in environment variables
;
; Unix
; export WIFI_SSID='"my ssid name"'
; export WIFI_PASS='"my password"'
;
; Windows
; set WIFI_SSID='"my ssid name"
; set WIFI_PASS='"my password"

[env:esp32dev]
extends = env:nodemcuv2
platform = espressif32
board = esp32dev
build_flags =
    -DWIFI_SSID=${sysenv.WIFI_SSID}
    -DWIFI_PASS=${sysenv.WIFI_PASS}
```

**Warning:** Be careful with special characters in system environment variables on Unix systems, especially when they are used as the value for preprocessor directives. Symbols like $, &, ~, etc must be explicitly escaped, for example:

```ini
export WIFI_PASS='"my\-p\&a\\$\\\$\$\\\$word"'
```

### 1.6.5 Examples

**Note:** A full list with project examples can be found in PlatformIO Repository.

Community project examples with `platformio.ini`:

- MarlinFirmware/Marlin
- xoseperez/espurna
- esphome/esphome
- cyberman54/ESP32-Paxcounter
- 1technophile/OpenMQTTGateway

**Example**
For more examples, see *Examples*.

```python
[platformio]
default_envs = nodemcu

; You MUST inject these options into [env:] section
; using $common_env_data.*** (see below)
[common_env_data]
build_flags =
  -D VERSION=1.2.3
  -D DEBUG=1
lib_deps_builtin =
  SPI
  Wire
lib_deps_external =
  ArduinoJson@~5.6,!=5.4
  https://github.com/gioblu/PJON.git#v2.0
  IRremoteESP8266=https://github.com/markszabo/IRremoteESP8266/archive/master.zip

[env:nodemcu]
platform = espressif8266
framework = arduino
board = nodemcu

; Build options
build_flags =
  ${common_env_data.build_flags}
  -DSSID_NAME=HELLO
  -DSSID_PASSWORD=WORLD

; Library options

test_ignore = test_desktop

[env:bluepill_f103c8]
platform = ststm32
framework = arduino
board = bluepill_f103c8

; Build options
build_flags = ${common_env_data.build_flags}

; Library options
lib_deps =
  ${common_env_data.lib_deps_external}
```

(continues on next page)
; Debug options
debug_tool = custom
ddebug_server =
   JLinkGDBServer
   -singlerun
   -if
   SWD
   -select
   USB
   -port
   2331
   -device
   STM32F103C8

; Unit Testing options
test_ignore = test_desktop

1.7 Environment variables

Environment variables are a set of dynamic named values that can affect the way running processes will behave on a computer. PlatformIO handles variables which start with PLATFORMIO_ prefix.

How to set environment variable?

# Windows
set VARIABLE_NAME=VALUE

# Windows GUI -> https://www.youtube.com/watch?v=bEroNNzqlF4

# Unix (bash, zsh)
export VARIABLE_NAME=VALUE

# Unix (fish)
set -x VARIABLE_NAME VALUE

1.7.1 General

PlatformIO uses General environment variables for the common operations/commands.
PlatformIO handles CI variable which is setup by Continuous Integration (Travis, Circle and etc.) systems. PlatformIO uses it to disable prompts and progress bars. In other words, CI=true automatically setup `PLATFORMIO_DISABLE_PROGRESSBAR` to true.

**PLATFORMIO Auth Token**

Allows one to specify Personal Authentication Token that could be used for automatic login into PlatformIO Account. It is very useful for Continuous Integration systems and Remote Development operations where you are not able manually authorize.

You can get own Personal Authentication Token using `pio account token` command.

**PLATFORMIO_FORCE_ANSI**

Force to output ANSI control character even if the output is a pipe (not a tty). The possible values are true and false. Default is `PLATFORMIO_FORCE_ANSI=false`.

**PLATFORMIO_NO_ANSI**

Do not print ANSI control characters. The possible values are true and false. Default is `PLATFORMIO_NO_ANSI=false`.

You can also use `pio --no-ansi` flag for PlatformIO Core (CLI).

**PLATFORMIO_DISABLE_PROGRESSBAR**

Disable progress bar for package/library downloader and uploader. This is useful when calling PlatformIO from subprocess and output is a pipe (not a tty). The possible values are true and false. Default is `PLATFORMIO_DISABLE_PROGRESSBAR=false`.

### 1.7.2 Directories

**PLATFORMIO_CORE_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `core_dir`.

It may need to re-install PlatformIO Core (CLI) (remove default core directory) to take effect.

**PLATFORMIO_GLOBALLIB_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `globallib_dir`.

**PLATFORMIO_PLATFORMS_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `platforms_dir`.

**PLATFORMIO_PACKAGES_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `packages_dir`.

**PLATFORMIO_CACHE_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `cache_dir`.

**PLATFORMIO_BUILD_CACHE_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `build_cache_dir`.

**PLATFORMIO_WORKSPACE_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `workspace_dir`.

**PLATFORMIO_INCLUDE_DIR**

Allows one to override "platformio.ini" (Project Configuration File) option `include_dir`.

**PLATFORMIO_SRC_DIR**

---

Chapter 1. Contents
Allows one to override “platformio.ini” (Project Configuration File) option src_dir.

**PLATFORMIO_LIB_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option lib_dir.

**PLATFORMIO_LIBDEPS_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option libdeps_dir.

**PLATFORMIO_BUILD_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option build_dir.

**PLATFORMIO_DATA_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option data_dir.

**PLATFORMIO_TEST_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option test_dir.

**PLATFORMIO_BOARDS_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option boards_dir.

**PLATFORMIO_SHARED_DIR**

Allows one to override “platformio.ini” (Project Configuration File) option shared_dir.

**PLATFORMIO_REMOTE_AGENT_DIR**

Allows one to override pio remote agent start --working-dir.

**PLATFORMIO_LIB_EXTRA_DIRS**

Allows one to set “platformio.ini” (Project Configuration File) option lib_extra_dirs.

### 1.7.3 Building

**PLATFORMIO_BUILD_FLAGS**

Allows one to set “platformio.ini” (Project Configuration File) option build_flags.

Examples:

```bash
# Unix:
export PLATFORMIO_BUILD_FLAGS=-DFOO
export PLATFORMIO_BUILD_FLAGS=-DFOO -DBAR=1 -Wall

# Windows:
SET PLATFORMIO_BUILD_FLAGS=-DFOO
SET PLATFORMIO_BUILD_FLAGS=-DFOO -DBAR=1 -Wall
```

**Warning:** Consider using *Dynamic variables* instead of PLATFORMIO_BUILD_FLAGS environment variable if additional build flags contain preprocessor directive with special characters ($, &, ~, etc) in its value.

**PLATFORMIO_SRC_BUILD_FLAGS**

Allows one to set “platformio.ini” (Project Configuration File) option src_build_flags.

**PLATFORMIO_SRC_FILTER**

### 1.7. Environment variables
Allows one to set “platformio.ini” (Project Configuration File) option `src_filter`.

**PLATFORMIO_EXTRA_SCRIPTS**

Allows one to set “platformio.ini” (Project Configuration File) option `extra_scripts`.

**PLATFORMIO_DEFAULT_ENVS**

Allows one to set “platformio.ini” (Project Configuration File) option `default_envs`.

### 1.7.4 Uploading

**PLATFORMIO_UPLOAD_PORT**

Allows one to set “platformio.ini” (Project Configuration File) option `upload_port`.

**PLATFORMIO_UPLOAD_FLAGS**

Allows one to set “platformio.ini” (Project Configuration File) option `upload_flags`.

### 1.7.5 Settings

Allows one to override PlatformIO settings. You can manage them via `pio settings` command.

**PLATFORMIO_SETTING_AUTO_UPDATE_LIBRARIES**

Allows one to override setting `auto_update_libraries`.

**PLATFORMIO_SETTING_AUTO_UPDATE_PLATFORMS**

Allows one to override setting `auto_update_platforms`.

**PLATFORMIO_SETTING_CHECK_LIBRARIES_INTERVAL**

Allows one to override setting `check_libraries_interval`.

**PLATFORMIO_SETTING_CHECK_PLATFORMIO_INTERVAL**

Allows one to override setting `check_platformio_interval`.

**PLATFORMIO_SETTING_CHECK_PLATFORMS_INTERVAL**

Allows one to override setting `check_platforms_interval`.

**PLATFORMIO_SETTING_ENABLE_CACHE**

Allows one to override setting `enable_cache`.

**PLATFORMIO_SETTING_ENABLE_TELEMETRY**

Allows one to override setting `enable_telemetry`.

**PLATFORMIO_SETTING_FORCE_VERBOSE**

Allows one to override setting `force_verbose`.

**PLATFORMIO_SETTING_PROJECTS_DIR**

Allows one to override setting `projects_dir`. 
1.8 Advanced Scripting

**Warning:** Advanced Scripting is recommended for Advanced Users and requires knowledge of the Python language.

**Warning:** *Dynamic build flags* is a highly recommended alternative to advanced scripting, where you can use any programming language. Also, that option is useful if you need to apply changes to the project before the building/uploading process, such as:

- Macro with the latest VCS revision/tag “on-the-fly”
- Generate dynamic headers (*.h)*
- Process media content before generating SPIFFS image
- Make some changes to source code or related libraries

**Contents**

- Advanced Scripting
  - Launch types
  - Construction Environments
  - Before/Pre and After/Post actions
  - Build Middlewares
  - Custom Targets
    - Build System API
    - Examples
      - Command shortcut
      - Dependent target
      - Target with options
  - Other Use Cases
    - Custom options in `platformio.ini`
    - Split C/C++ build flags
    - Extra Linker Flags without `-Wl`, prefix
    - Custom upload tool
    - Upload to Cloud (OTA)
    - Custom firmware/program name
    - Override package files
    - Override Board Configuration
    - Custom debug flags
* Extra Python packages

The PlatformIO Build System allows the user to extend the build process with custom scripts using the Python interpreter and the SCons construction tool. Build flags, upload flags, targets, toolchains data and other information are available for modification as SCons Construction Environments. Custom scripts are included with `extra_scripts`

**Warning:** You cannot run or debug these scripts manually with a Python interpreter. They will be loaded automatically when the `pio run` command processes the project environment.

### 1.8.1 Launch types

There are two execution orders for extra scripts:

1. **PRE** - executes before the main script of *Development Platforms*
2. **POST** - executes after the main script of *Development Platforms*

Multiple extra scripts are allowed. Please split them via “,” (comma + space) in the same line or use multi-line values.

For example, in “`platformio.ini`” (Project Configuration File):

```ini
[env:my_env_1]
platform = ...
; Defaults to POST script since no prefix is used
extra_scripts = post_extra_script.py

[env:my_env_2]
platform = ...
extra_scripts =
    pre:pre_extra_script.py
    post:post_extra_script1.py
    post:post_extra_script2.py
```

This option can also be set by the global environment variable `PLATFORMIO_EXTRA_SCRIPTS`.

### 1.8.2 Construction Environments

The PlatformIO Build System uses two built-in construction environments to process each project:

- `env, Import("env")` - the global construction environment used for the *Development Platforms* and Framesworks build scripts, upload tools, *Library Dependency Finder (LDF)*, and other internal operations
- `projenv, Import("projenv")` - the isolated construction environment used for processing the project source code in `src_dir`. Please note that any `src_build_flags` specified in “`platformio.ini`” (Project Configuration File) will be passed to `projenv` and not to `env`.

**Warning:**

1. `projenv` is available only for POST-type scripts
2. Flags passed to `env` using PRE-type script will affect `projenv` too.

`my_pre_extra_script.py:`
Import("env")

# access to global construction environment
print(env)

# Dump construction environment (for debug purpose)
print(env.Dump())

# append extra flags to global build environment
# which later will be used to build:
#  - project source code
#  - frameworks
#  - dependent libraries
env.Append(CPPDEFINES=[
   "MACRO_1_NAME",
   ("MACRO_2_NAME", "MACRO_2_VALUE")
])

my_post_extra_script.py:

Import("env", "projenv")

# access to global construction environment
print(env)

# access to project construction environment
print(projenv)

# Dump construction environments (for debug purpose)
print(env.Dump())
print(projenv.Dump())

# append extra flags to global build environment
# which later will be used to build:
#  - frameworks
#  - dependent libraries
env.Append(CPPDEFINES=[
   "MACRO_1_NAME",
   ("MACRO_2_NAME", "MACRO_2_VALUE")
])

# append extra flags to only project build environment
projenv.Append(CPPDEFINES=[
   "PROJECT_EXTRA_MACRO_1_NAME",
   ("PROJECT_EXTRA_MACRO_2_NAME", "PROJECT_EXTRA_MACRO_2_VALUE")
])

See examples below how to import construction environments and modify existing data or add new.

1.8.3 Before/Pre and After/Post actions

The PlatformIO Build System has a rich API that allows one to attach different pre-/post actions (hooks) using env.AddPreAction(target, callback) or env.AddPreAction(target, [callback1, callback2, ...]) function. The first argument target can be the name of a target that is passed using the pio run --target command, the name of a built-in target (buildprog, size, upload, program, buildfs, uploadfs, uploadfsota) or the path to a file which PlatformIO processes (ELF, HEX, BIN, OBJ, etc.).
Examples

The `extra_script.py` file is located in the same directory as `platformio.ini`.

```ini
[env:pre_and_post_hooks]
extra_scripts = post:extra_script.py
```

```python
extra_script.py:
import "env", "projenv"

# access to global build environment
print(env)

# access to project build environment (is used source files in "src" folder)
print(projenv)

# Dump build environment (for debug purpose)
# print(env.Dump())

# Change build flags in runtime
env.ProcessUnFlags("-DVECT_TAB_ADDR")
env.Append(CPPDEFINES=("VECT_TAB_ADDR", 0x123456789))

# Upload actions

def before_upload(source, target, env):
    print("before_upload")
    # do some actions
    # call Node.JS or other script
    env.Execute("node --version")

def after_upload(source, target, env):
    print("after_upload")
    # do some actions

print("Current build targets", map(str, BUILD_TARGETS))

env.AddPreAction("upload", before_upload)
env.AddPostAction("upload", after_upload)

# Custom actions when building program/firmware
env.AddPreAction("buildprog", callback...)
env.AddPostAction("buildprog", callback...)
```

(continues on next page)
# Custom actions for specific files/objects

```python
env.AddPreAction("$BUILD_DIR/${PROGNAME}.elf", [callback1, callback2,...])
env.AddPostAction("$BUILD_DIR/${PROGNAME}.hex", callback...)
```

# custom action before building SPIFFS image. For example, compress HTML, etc.
```python
env.AddPreAction("$BUILD_DIR/spiffs.bin", callback...)
```

# custom action for project's main.cpp
```python
env.AddPostAction("$BUILD_DIR/src/main.cpp.o", callback...)
```

# Custom HEX from ELF
```python
env.AddPostAction(
    "$BUILD_DIR/${PROGNAME}.elf",
    env.VerboseAction("".join(
        "$OBJCOPY", "-0", "ihex", "-R", ".eeprom",
        "$BUILD_DIR/${PROGNAME}.elf", "$BUILD_DIR/${PROGNAME}.hex"
    ), "Building $BUILD_DIR/${PROGNAME}.hex"
)
)
```

## 1.8.4 Build Middlewares

PlatformIO Build System allows you to add middleware functions that can be used for Build Node(Object) construction. This is very useful if you need to add custom flags for the specific file nodes or exclude them from a build process.

There is `env.AddBuildMiddleware(callback, pattern)` helper which instructs PlatformIO Build System to call `callback` for each SCons File System Node whose path matches with Unix shell-style “pattern” (wildcards).

If a pattern is omitted, the callback will be called for each File System Node which is added for the build process.

You can add an unlimited number of build middlewares. They will be called in order of registration. Please note, if the first middleware ignores some File Nodes, they will not be passed to the next middleware in chain.

### Examples

**platformio.ini:**

```
[env:build_middleware]
extra_scripts = pre:extra_script.py
```

**extra_script.py:**

```python
import("env")

# --- Add custom macros for the ALL files which name contains "http"
def extra_http_configuration(node):
    ""
    "node.name" - a name of File System Node
    "node.get_path()" - a relative path
    "node.get_abspath()" - an absolute path
    ""
```

1.8. Advanced Scripting
# do not modify node if file name does not contain "http"
if "http" not in node.name:
    return node

# now, we can override ANY SCons variables (CPPDEFINES, CCFLAGS, etc.,) for the
# specific file
# pass SCons variables as extra keyword arguments to `env.Object()` function
# p.s: run `pio run -t envdump` to see a list with SCons variables
return env.Object(node,
    CPPDEFINES=env['CPPDEFINES']
    + [('HTTP_HOST', device.local), ('HTTP_PORT', 8080)],
    CCFLAGS=env['CCFLAGS'] + ['-fno-builtin-printf'])

env.AddBuildMiddleware(extra_http_configuration)

# --- Replace some file from a build process with another

def replace_node_with_another(node):
    return env.File(path/to/patched/RtosTimer.cpp)

env.AddBuildMiddleware(replace_node_with_another,
    "framework-mbed/rtos/RtosTimer.cpp")

# --- Skip assembly *.S files from build process

def skip_asm_from_build(node):
    # to ignore file from a build process, just return None
    return None

env.AddBuildMiddleware(skip_asm_from_build, "*.S")

### 1.8.5 Custom Targets

New in version 5.0.

PlatformIO allows you to declare unlimited number of the custom targets. There are a lot of use cases for them:

- Pre/Post processing based on a dependent sources (other target, source file, etc.)
- Command launcher with own arguments
- Launch command with custom options declared in “platformio.ini” (Project Configuration File)
- Python callback as a target (use the power of Python interpreter and PlatformIO Build API).

A custom target can be processed using `pio run --target` option and you can list them via `pio run --list-targets` command.
Build System API

Import("env")

env.AddCustomTarget(
    name,
    dependencies,
    actions,
    title=None,
    description=None,
    always_build=True
)

AddCustomTarget arguments:

- **name** A name of target. ASCII chars (a-z, 0-9, _, -) are recommended. Good names are “gen_headers”, “program_bitstream”, etc.
- **dependencies** A list of dependencies that should be built BEFORE target will be launched. It is possible to pass multiple dependencies as a Python list ["dep1", dep_target_2]. If a target does not have dependencies, None should be passed.
- **actions** A list of actions to call on a target. It is possible to pass multiple actions as a Python list ["python --version", my_callback].
- **title** A title of a target. It will be printed when using PlatformIO Core (CLI) or PlatformIO IDE. We recommend to keep a title very short, 1-2 words.
- **description** The same as a title argument but allows you to provide detailed explanation what target does.
- **always_build** If there are declared dependencies and they are already built, this target will not be called if always_build=False. A default value is always_build=True and means always building/calling target.

Examples

Command shortcut

Create a custom node target (alias) which will print a NodeJS version

```
platformio.ini:

[env:myenv]
platform = ...
...
extra_scripts = extra_script.py
```

extra_script.py:

```
import("env")

# Single action/command per 1 target
env.AddCustomTarget("sysenv", None, "python -c "import os; print(os.environ)""

# Multiple actions
env.AddCustomTarget(
```

(continues on next page)
Now, run `pio run --target sysenv` or `pio run -t pioenv` (short version).

**Dependent target**

Sometimes you need to run a command which depends on another target (file, firmware, etc). Let’s create an `ota` target and declare command which will depend on a project firmware. If a build process successes, declared command will be run.

**platformio.ini:**

```ini
[env:myenv]
platform = ...
...
extra_scripts = extra_script.py
```

**extra_script.py:**

```python
Import("env")

env.AddCustomTarget(
    "ota",
    "$BUILD_DIR/$SOURCE.elf",
    "ota_script --firmware-path $SOURCE"
)
```

Now, run `pio run -t ota`.

**Target with options**

Let’s create a simple `ping` target and process it with `pio run --target ping` command:

**platformio.ini:**

```ini
[env:env_custom_target]
platform = ...
...
extra_scripts = extra_script.py
custom_ping_host = google.com
```

**extra_script.py:**

```python
Import("env")

host = env.GetProjectOption("custom_ping_host")
```

(continues on next page)
**1.8.6 Other Use Cases**

The best examples are PlatformIO development platforms. Please check builder folder for the main and framework scripts.

**Custom options in platformio.ini**

PlatformIO allows you extending project configuration with own data. You can read these values later using ProjectConfig API:

- `ProjectConfig::get(section, option, default=None)`: Get an option value for the named section
- `ProjectConfig::options(section)`: Returns a list of the sections available
- `ProjectConfig::items(section, as_dict=False)`: Returns a list of “name”, “value” pairs for the options in the given section or a dictionary when as_dict=True is passed
- `ProjectConfig::has_section(section)`: Indicates whether the named section is present in the configuration
- `ProjectConfig::has_option(section, option)`: If the given section exists, and contains the given option, returns True; otherwise returns False.

PlatformIO’s “ProjectConfig” is compatible with a native Python’s ConfigParser API.

**Example**

platformio.ini:

```ini
[universe]
hello = world

[env:my_env]
platform = ...
extra_scripts = extra_script.py

custom_option1 = value1
custom_option2 = value2
```

eextra_script.py:

```python
# "env.GetProjectOption" shortcut for the active environment
value1 = env.GetProjectOption("custom_option1")
value2 = env.GetProjectOption("custom_option2")

# Read value from other environments
config = env.GetProjectConfig()
world = config.get("universe", "hello")
```
Split C/C++ build flags

platformio.ini:

```ini
[env:my_env]
platform = ...
extra_scripts = extra_script.py
```

eextra_script.py (place it near platformio.ini):

```python
import("env")

# General options that are passed to the C and C++ compilers
env.Append(CCFLAGS=['flag1', 'flag2'])

# General options that are passed to the C compiler (C only; not C++).
env.Append(CFLAGS=['flag1', 'flag2'])

# General options that are passed to the C++ compiler
env.Append(CXXFLAGS=['flag1', 'flag2'])
```

Extra Linker Flags without –Wl, prefix

Sometimes you need to pass extra flags to GCC linker without –Wl,. You could use build_flags option but it will not work. PlatformIO will not parse these flags to LINKFLAGS scope. In this case, simple extra script will help:

platformio.ini:

```ini
[env:env_extra_link_flags]
platform = windows_x86
extra_scripts = extra_script.py
```

eextra_script.py (place it near platformio.ini):

```python
import("env")

# Dump build environment (for debug)
# print(env.Dump())

env.Append(LINKFLAGS=['-static',
                      '-static-libgcc',
                      '-static-libstdc++'])
```

Custom upload tool

You can override default upload command of development platform using extra script. There is the common environment variable UPLOADCMD which PlatformIO Build System will handle when you `pio run -t upload`.

Please note that some development platforms can have more than 1 upload command. For example, Atmel AVR has UPLOADHEXCMD (firmware) and UPLOADEEPCMD (EEPROM data).
See examples below:

**Template**

```
platformio.ini:
```

```
[env:my_custom_upload_tool]
platform = ...
; place it into the root of project or use full path
extrascripts = extra_script.py
upload_protocol = custom
; each flag in a new line
uploadflags =
-arg1
-arg2
-argN
```

```
extra_script.py (place it near platformio.ini):
```

```
import("env")

# please keep $SOURCE variable, it will be replaced with a path to firmware

# Generic
env.Replace(
    UPLOADER="executable or path to executable",
    UPLOADCMD="$UPLOADER $UPLOADERFLAGS $SOURCE"
)

# In-line command with arguments
env.Replace(
    UPLOADCMD="executable -arg1 -arg2 $SOURCE"
)

# Python callback
def on_upload(source, target, env):
    print(source, target)
    firmware_path = str(source[0])
    # do something
    env.Execute("executable arg1 arg2")

env.Replace(UPLOADCMD=on_upload)
```

**Custom openOCD command**

```
platformio.ini:
```

```
[env:disco_f407vg]
platform = ststm32
board = disco_f407vg
framework = mbed
extra_scripts = extra_script.py
upload_protocol = custom
; each flag in a new line
uploadflags =
- $f
    scripts/interface/stlink.cfg
- $f
```

(continues on next page)
extra_script.py (place it near platformio.ini):

```python
import("env")

platform = env.PioPlatform()

env.Prepend(
    UPLOADERFLAGS=["-s", platform.get_package_dir("tool-openocd") or "]
)
env.Append(
    UPLOADERFLAGS=["-c", "program {{SOURCE}} verify reset; shutdown"]
)
env.Replace(
    UPLOADER=openocd,
    UPLOADCMD="$UPLOADER $UPLOADERFLAGS"
)
```

Upload to Cloud (OTA)

See project example https://github.com/platformio/bintray-secure-ota

Custom firmware/program name

Sometimes is useful to have a different firmware/program name in `build_dir`

platformio.ini:

```ini
[env:env_custom_prog_name]
platform = espressif8266
board = nodemcuv2
framework = arduino
build_flags = -D VERSION=13
extra_scripts = pre:extra_script.py
```

```python
import("env")

my_flags = env.ParseFlags(env['BUILD_FLAGS'])
defines = {k: v for (k, v) in my_flags.get("CPPDEFINES"))
# print(defines)
env.Replace(PROGNAME="firmware_%s" % defines.get("VERSION"))
```

Override package files

PlatformIO Package Manager automatically installs pre-built packages (Frameworks, toolchains, libraries) required by development Development Platforms and build process. Sometimes you need to override original files with own versions: configure custom GPIO, do changes to built-in LD scripts, or some patching to installed library dependency.

The simplest way is using Diff and Patch technique. How does it work?
1. Modify original source files
2. Generate patches
3. Apply patches via PlatformIO extra script before build process.

Example

We need to patch the original `standard/pins_arduino.h` variant from Arduino framework and add extra macro 

```diff
# define PIN_A8 (99)
```

Let's duplicate `standard/pins_arduino.h` and apply changes. Generate a patch file and place it into `patches` folder located in the root of a project:

```diff
diff ~/.platformio/packages/framework-arduinoavr/variants/standard/pins_arduino.h /→tmp/pins_arduino_modified.h > /path/to/platformio/project/patches/1-framework-→arduinoavr-add-pin-a8.patch
```

The result of `1-framework-arduinoavr-add-pin-a8.patch`:

```diff
63a64 > # define PIN_A8 (99)
112c113 < // 14-21 PA0-PA7 works
---
> // 14-21 PA0-PA7 works
```

Using extra scripting we can apply patching before a build process. The final result of “`platformio.ini`” (Project Configuration File) and “PRE” extra script named `apply_patches.py`:

```
platformio.ini:
```

```
[env:uno]
platform = atmelavr
board = uno
framework = arduino
extra_scripts = pre:apply_patches.py
```

```
apply_patches.py:
```

```
from os.path import join, isfile 

env.Execute("touch " + patchflag_path)
```

(continues on next page)
env.Execute(lambda *args, **kwargs: _touch(patchflag_path))

Please note that this example will work on a system where a patch tool is available. For Windows OS, you can use patch and diff tools provided by Git client utility (located inside installation directory).

If you need to make it more independent to the operating system, please replace the patch with a multi-platform python-patch script.

**Override Board Configuration**

PlatformIO allows one to override some basic options (integer or string values) using More options in “platformio.ini” (Project Configuration File). Sometimes you need to do complex changes to default board manifest and extra PRE scripting work well here. See example below how to override default hardware VID/PIDs.

**Warning:** Due to a technical limitation these board changes will not work for pio device monitor command.

platformio.ini:

```
[env:uno]
platform = atmelavr
board = uno
framework = arduino
extra_scripts = pre:custon_hwids.py
```

custon_hwids.py:

```
Import("env")

board_config = env.BoardConfig()
# should be array of VID:PID pairs
board_config.update("build.hwids", [
    ["0x2341", "0x0243"],  # 1st pair
    ["0x2A03", "0x0043"].  # 2nd pair, etc.
])
```

**Custom debug flags**

PlatformIO removes all debug/optimization flags before a debug session or when Build Configurations is set to debug and overrides them with -0g -g2 -ggdb2 for ASFLAGS,CCFLAGS, and LINKFLAGS build scopes.

An extra script allows us to override PlatformIO’s default behavior and declare custom flags. See example below where we override -Og with -00:

platformio.ini:

```
[env:teensy31]
platform = teensy
board = teensy31
framework = arduino
extra_scripts = custom_debug_flags.py
```

custom_debug_flags.py:
Extra Python packages

If your project depends on the extra Python packages, you can use extra script to install them into the same virtual environment where PlatformIO Core (CLI) is installed.

platformio.ini:

```
[env:my_env]
platform = ...
extra_scripts = extra_script.py
```

eextra_script.py (place it near platformio.ini):

```
import("env")

# List installed packages
env.Execute("$PYTHONEXE -m pip list")

# Install custom packages from the PyPi registry
env.Execute("$PYTHONEXE -m pip install pkg1 pkg2")
```

1.9 Library Management

PlatformIO Library Manager is a tool for managing libraries of PlatformIO Registry and VCS repositories (Git, Hg, SVN). It makes it exceedingly simple to find, install and keep libraries up-to-date. PlatformIO Library Manager supports Semantic Versioning and its rules.

PlatformIO IDE has built-in PlatformIO Home with a modern GUI which allows:

- Search for new libraries in PlatformIO Registry
- “1-click” library installation, per-project libraries, extra storages
- List installed libraries in multiple storages
- List built-in libraries (by frameworks)
- Updates for installed libraries
- Multiple examples, trending libraries, and more.
1.9.1 Quick Start

PlatformIO Library Manager is a tool for managing libraries of PlatformIO Registry and VCS repositories (Git, Hg, SVN). It makes it exceedingly simple to find, install and keep libraries up-to-date. PlatformIO Library Manager supports Semantic Versioning and its rules.

There are 3 options how to find/manage libraries:

- PlatformIO Home
- Web Library Search
- PlatformIO Core Command Line Interface

You can manage different library storages using `pio lib --global` or `pio lib --storage-dir` options. If you change current working directory in terminal to project folder, then `pio lib` command will manage automatically dependency storage in `libdeps_dir`.

Project dependencies

PlatformIO Library Manager allows one to specify project dependencies (`lib_deps`) that will be installed automatically per project before environment processing. You do not need to install libraries manually. The only one simple step is to define dependencies in “platformio.ini” (Project Configuration File). For example,

```
[env:myenv]
platform = ...
framework = ...
board = ...
lib_deps =
    knolleary/PubSubClient
    bblanchon/ArduinoJson @ ~5,!=5.4
    https://github.com/gioblu/PJON.git#v2.0
    https://github.com/me-no-dev/ESPAsyncTCP.git
    https://github.com/adafruit/DHT-sensor-library/archive/master.zip
```

Please follow to `pio lib install` for detailed documentation about possible values.

**Warning:** If some libraries are not visible in PlatformIO IDE and Code Completion or Code Linting does not work properly, please perform

- **VSCode:** “Menu: View > Command Palette… > PlatformIO: Rebuild C/C++ Project Index”

PlatformIO IDE

PlatformIO IDE has built-in PlatformIO Home with a modern GUI which allows:
PlatformIO Core

CLI Guide

1.9.2 Library Dependency Finder (LDF)

Library Dependency Finder is a core part of PlatformIO Build System that operates with the C/C++ source files and looks for `#include ...` directives to know what header directories to include for the compiler.

In spite of the fact that Library Dependency Finder is written in pure Python, it evaluates C/C++ Preprocessor conditional syntax (`#ifdef`, `if`, `defined`, `else`, and `elif`) without calling `gcc -E`. This approach allows to significantly reduce the total compilation time. See Dependency Finder Mode for more details.

Contents

- Library Dependency Finder (LDF)
  - Configuration
  - Storage
  - Dependency Finder Mode
  - Compatibility Mode
  - C/C++ Preprocessor conditional syntax

Configuration

Library Dependency Finder can be configured from “platformio.ini” (Project Configuration File):
Storage

There are different storages where Library Dependency Finder looks for libraries. These storages (folders) have priority and LDF operates in the next order:

1. `lib_extra_dirs` - extra storages per build environment
2. `lib_dir` - own/private library storage per project
3. `libdeps_dir` - project dependency storage used by Library Management
4. “core_dir/lib” - global storage per all projects.
5. Library storages built into frameworks, SDKs.

Dependency Finder Mode

Library Dependency Finder starts work from analyzing source files of the project (`src_dir`) and can work in the next modes:

- **off** “Manual mode”, does not process source files of a project and dependencies. Builds only the libraries that are specified in manifests (`library.json`, `module.json`) or using `lib_deps` option.
- **chain** [DEFAULT] Parses ALL C/C++ source files of the project and follows only by nested includes (`#include ...`, `chain...`) from the libraries. It also parses C, CC, CPP files from libraries which have the same name as included header file. **Does not evaluate C/C++ Preprocessor conditional syntax.**
- **deep** Parses ALL C/C++ source files of the project and parses ALL C/C++ source files of the each found dependency (recursively). **Does not evaluate C/C++ Preprocessor conditional syntax.**
- **chain+** The same behavior as for the chain but **evaluates C/C++ Preprocessor conditional syntax.**
- **deep+** The same behavior as for the deep but **evaluates C/C++ Preprocessor conditional syntax.**

The mode can be changed using `lib_ldf_mode` option in “platformio.ini” (Project Configuration File). Default value is set to chain.

Note: Usually, when the LDF appears to fail to identify a dependency of a library, it is because the dependency is only referenced from a library source file, and not a library header file (see example below). In this case, it is necessary to either explicitly reference the dependency from the project source or “platformio.ini” (Project Configuration File) (`lib_deps` option), or change the LDF mode to “deep” (not generally recommended).

A difference between chain/chain+ and deep/deep+ modes. For example, there are 2 libraries:

- Library Foo with files:
  - Foo/foo.h
  - Foo/foo.cpp
  - Foo/extra.cpp
- Library Bar with files:
  - Bar/bar.h
  - Bar/bar.cpp

**Case 1**

- `lib_ldf_mode = chain`
• Foo/foo.h depends on the Bar library (contains #include <bar.h>)
• #include <foo.h> is located in one of the project source files

Here the nested includes (project file > foo.h > bar.h) and LDF will find both libraries Foo and Bar.

Case 2

• lib_ldf_mode = chain
• Foo/extra.cpp depends on the Bar library (contains #include <bar.h>)
• #include <foo.h> is located in one of the project source files

In this case, LDF will not find the Bar library because it doesn’t know about the CPP file (Foo/extra.cpp).

Case 3

• lib_ldf_mode = deep
• Foo/extra.cpp depends on Bar library (contains #include <bar.h>)
• #include <foo.h> is located in one of the project source files

Firstly, LDF finds the Foo library, then it parses all sources from the Foo library and finds Foo/extra.cpp that depends on #include <bar.h>. Secondly, it will parse all sources from the Bar library. This operation continues until all dependencies will not be parsed.

Compatibility Mode

Compatibility mode allows one to control strictness of Library Dependency Finder. If library contains one of manifest file (library.json, library.properties, module.json), then LDF check compatibility of this library with real build environment. Available compatibility modes:

off Does not check for compatibility (is not recommended)
soft [DEFAULT] Checks for the compatibility with framework from build environment
strict Checks for the compatibility with framework and platform from build environment.

This mode can be changed using lib_compat_mode option in “platformio.ini” (Project Configuration File). Default value is set to soft.

C/C++ Preprocessor conditional syntax

In spite of the fact that Library Dependency Finder is written in pure Python, it evaluates C/C++ Preprocessor conditional syntax (#ifdef, if, defined, else, and elif) without calling gcc -E. For example,

```
[env:myenv]
lib_ldf_mode = chain+
bld_flags = -D MY_PROJECT_VERSION=13
```

mylib.h
#ifdef MY_PROJECT_VERSION
// include common file for the project
#include "my_common.h"
#endif

#if MY_PROJECT_VERSION < 10
// this include will be ignored because does not satisfy condition above
#include "my_old.h"
#endif

### 1.9.3 library.json

library.json is a manifest file of a library package. It allows developers to keep a project in its own structure and define:

- compatible frameworks and platforms
- external dependencies
- advanced build settings.

A data in library.json should be represented in JSON-style via associative array (name/value pairs). An order doesn’t matter. The allowable fields (names from pairs) are described below.

You can validate library.json manifest file using `pio package pack` command.

#### Fields

- `name`
- `version`
- `description`
- `keywords`
- `repository`
- `authors`
- `license`
- `homepage`
- `export`
  - `include`
  - `exclude`
- `frameworks`
- `platforms`
- `dependencies`
- `examples`
- `build`
  - `flags`
name

**Required** | **Type:** String | **Max. Length:** 50

A name of a library.

- Must be unique
- Should be slug style for simplicity, consistency, and compatibility. Example: *HelloWorld*
- Can contain a-z, digits, and dashes (but not start/end with them)
- Consecutive dashes and [:;/,@<>] chars are not allowed.

version

**Required** | **Type:** String | **Max. Length:** 20

A version of a current library source code. Can contain a-z, digits, dots or dash and should be Semantic Versioning compatible.

Example:

```json
"name": "Bar",
"version": "1.0.0",
"repository": {
   "type": "git",
   "url": "https://github.com/foo/bar.git"
}
```

description

**Required** | **Type:** String | **Max. Length:** 255

The field helps users to identify and search for your library with a brief description. Describe the hardware devices (sensors, boards and etc.) which are suitable with it.
keywords

**Required** | Type: String or Array | Max. Length: 255

Used for search by keyword. Helps to make your library easier to discover without people needing to know its name. The keyword should be lowercased, can contain a-z, digits and dash (but not start/end with them). A list from the keywords can be specified with separator , or declared as Array.

repository

**Optional** | Type: Object

The repository in which the source code can be found. The field consists of the next items:

- **type** the only “git”, “hg” or “svn” are supported
- **url**
- **branch** if is not specified, default branch will be used. This field will be ignored if tag/release exists with the value of version.

Example:

```json
"repository": {
  "type": "git",
  "url": "https://github.com/foo/bar.git"
}
```

authors

**Optional** | Type: Object or Array

An author contact information

- **name** Full name (**Required**)
- **email**
- **url** An author’s contact page
- **maintainer** Specify “maintainer” status

Examples:

```json
"authors": {
  "name": "John Smith",
  "email": "me@john-smith.com",
  "url": "https://www.john-smith/contact"
}
```

```json
..."authors": {

  "name": "John Smith",
  "email": "me@john-smith.com",
}
```

(continues on next page)

Note: If authors field is not defined, PlatformIO will try to fetch data from VCS provider (Github, Gitlab, etc) if repository is declared.

**license**

*Optional* | *Type:* String

A SPDX license ID of the library. You can check the full list of SPDX license IDs (see “Identifier” column).

"license": "Apache-2.0"

**homepage**

*Optional* | *Type:* String | Max. Length: 255

Home page of a library (if is different from repository url).

**export**

*Optional* | *Type:* Object

This option is useful if you need to exclude extra data (test code, docs, images, PDFs, etc). It allows one to reduce the size of the final archive.

To check which files will be included in the final packages, please use `pio package pack` command.

Possible options:

- *include*
- *exclude*

**include**

*Optional* | *Type:* Array | *Glob Pattern*

Export only files that matched declared patterns.

**Pattern Meaning**
<table>
<thead>
<tr>
<th>Pattern</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td>matches everything</td>
</tr>
<tr>
<td>?</td>
<td>matches any single character</td>
</tr>
<tr>
<td>[seq]</td>
<td>matches any character in seq</td>
</tr>
<tr>
<td>![seq]</td>
<td>matches any character not in seq</td>
</tr>
</tbody>
</table>

Example:

```
"export": {
    "include": [
        "dir/*/.[ch]pp",
        "dir/examples/*",
        "*/*/.h"
    ]
}
```

**exclude**

*Optional* | Type: *Array* | *Glob Pattern*
Exclude the directories and files which match with *exclude* patterns.

**frameworks**

*Optional* | Type: *String* or *Array*
A list with compatible frameworks. The available framework names are defined in the *Frameworks* section.
Example:

```
"frameworks": ["espidf", "freertos"]
```

If the library is compatible with the all frameworks, then do not declare this field or you use * symbol:

```
"frameworks": "*
```

**platforms**

*Optional* | Type: *String* or *Array*
A list with compatible development platforms. The available platform names are defined in *Development Platforms* section.
Example:

```
"frameworks": ["atmelavr", "espressif8266"]
```

If the library is compatible with the all platforms, then do not declare this field or use * symbol:

```
"platforms": "*
```
dependencies

Optional | Type: Array or Object

A list of dependent libraries. They will be installed automatically with `pio lib install` command.

Allowed requirements for dependent library:

- `owner` | Type: String – an owner name (username) from the PlatformIO Registry
- `name` | Type: String – library name
- `version` | Type: String – version or version range in SemVer format
- `frameworks` | Type: String or Array – project compatible Frameworks
- `platforms` | Type: String or Array – project compatible Development Platforms

The version supports Semantic Versioning (`<major>.<minor>.<patch>`) and can take any of the following forms:

- `1.2.3` - an exact version number. Use only this exact version
- `^1.2.3` - any compatible version (exact version for `1.x.x` versions
- `~1.2.3` - any version with the same major and minor versions, and an equal or greater patch version
- `>1.2.3` - any version greater than `1.2.3`.
- `>=`, `<`, and `<=` are also possible
- `>0.1.0,!=0.2.0,<0.3.0` - any version greater than `0.1.0`, not equal to `0.2.0` and less than `0.3.0`

The rest possible values including VCS repository URLs are documented in `pio lib install` command.

Example:

```
"dependencies":
  [
    {
      "owner": "bblanchon",
      "name": "ArduinoJson",
      "version": "^6.16.1"
    },
    {
      "owner": "me-no-dev",
      "name": "AsyncTCP",
      "version": "*",
      "platforms": ["espressif32"]
    },
    {
      "name": "external-repo",
      "version": "https://github.com/user/package.git@1.2.3"
    },
    {
      "name": "external-zip",
      "version": "https://github.com/me-no-dev/AsyncTCP/archive/master.zip"
    }
  ]
```

A short definition of dependencies is allowed:

```
"dependencies":
  {
    "bblanchon/ArduinoJson": "^6.16.1",
  }
```

(continues on next page)
examples

Optional | Type: Array | Glob Pattern

A list of example patterns. This field is predefined with default value:

```json
"examples": [
  {
    "name": "Hello",
    "base": "examples/world",
    "files": [
      "platformio.ini",
      "include/world.h",
      "src/world.c",
      "README",
      "extra.py"
    ]
  },
  {
    "name": "Blink",
    "base": "examples/blink",
    "files": ["blink.cpp", "blink.h"]
  }
]
```

build

Optional | Type: Object

Specify advanced settings, options and flags for the build system. Possible options:

- flags
- unflags
- includeDir
- srcDir
- srcFilter
- extraScript
- libArchive
- libLDFMode
- libCompatMode
flags

Optional | Type: String or Array
Extra flags to control preprocessing, compilation, assembly and linking processes. More details build_flags.

unflags

Optional | Type: String or Array
Remove base/initial flags which were set by development platform. More details build_unflags.

includeDir

Optional | Type: String
Custom location of library header files. A default value is include and means that folder is located in the root of a library.

srcDir

Optional | Type: String
Custom location of library source code. A default value is src and means that folder is located in the root of a library.

srcFilter

Optional | Type: String or Array
Specify which source files should be included/excluded from build process. The path in filter should be relative to the srcDir option of a library.
See syntax in src_filter.
Please note that you can generate source filter “on-the-fly” using extraScript (see below)

extraScript

Optional | Type: String
Launch extra script before build process. More details extra_scripts.

Example (HAL-based library)
This example demonstrates how to build HAL-dependent source files and exclude other source files from a build process.
Project structure

```
lib
    README
    SomeLib
        extra_script.py
        hal
```
(continues on next page)
platformio.ini

[env:foo]
platform = native
build_flags = -DHAL=foo

[env:bar]
platform = native
build_flags = -DHAL=bar

library.json

{
    "name": "SomeLib",
    "version": "0.0.0",
    "build": {
        "extraScript": "extra_script.py"
    }
}

extra_script.py

Import('env')
from os.path import join, realpath

# private library flags
for item in env.get("CPPDEFINES", []):
    if isinstance(item, tuple) and item[0] == "HAL":
        env.Append(CPPPATH=[realpath(join("hal", item[1]))])
        env.Replace(SRC_FILTER=["+<*>", "-<hal>", "+<%s>" % join("hal", item[1])])
        break

# pass flags to a global build environment (for all libraries, etc)
global_env = DefaultEnvironment()
global_env.Append(
    CPPDEFINES=[
        ("MQTT_MAX_PACKET_SIZE", 512),
        "ARDUINOJSON_ENABLE_STD_STRING",
        ("BUFFER_LENGTH", 32)
    ]
)
libArchive

*Optional | Type: Boolean*

Create an archive (*.a, static library) from the object files and link it into a firmware (program). This is default behavior of PlatformIO Build System ("libArchive": true).

Setting "libArchive": false will instruct PlatformIO Build System to link object files directly (in-line). This could be useful if you need to override weak symbols defined in framework or other libraries.

You can disable library archiving globally using *lib_archive* option in “platformio.ini” (Project Configuration File).

libLDFMode

*Optional | Type: String*

Specify Library Dependency Finder Mode. See Dependency Finder Mode for details.

libCompatMode

*Optional | Type: String*

Specify Library Compatibility Mode. See Compatibility Mode for details.

Examples

1. Custom macros/defines

```json
"build": {
    "flags": "-D MYLIB_REV=1.2.3 -DRELEASE"
}
```

2. Extra includes for C preprocessor

```json
"build": {
    "flags": [
        "-I inc",
        "-I inc/target_x13"
    ]
}
```

3. Force to use C99 standard instead of C11

```json
"build": {
    "unflags": "-std=gnu++11",
    "flags": "-std=c99"
}
```

4. Build source files (.c, .cpp, .h) at the top level of the library

```json
"build": {
    "srcFilter": [
        "+<*.c>",
        "+<*.cpp>",
        "+<*.h>"
    ]
}
```

(continues on next page)
5. Extend PlatformIO Build System with own extra script

```json
"build": {
    "extraScript": "generate_headers.py"
}
```

generate_headers.py

```python
import ('env')
# print(env.Dump())
env.Append(
    CPPDEFINES=["HELLO=\"WORLD\", "TAG=1.2.3", "DEBUG"],
    CPPPATH=["inc", "inc/devices"]
)

# some python code that generates header files "on-the-fly"
```

### 1.9.4 Creating Library

Managing components between the projects is a historical issue. A common code is duplicated between different projects that lead to project complexity. A good practice is to organize interdependent components as the separate libraries where other projects can depend on them.

PlatformIO has a built-in *Library Management* where developers can declare project dependencies and PlatformIO will automatically manage them (install, build, update). It doesn’t have any requirements for a library source code structure. The only requirement is a library manifest file - `library.json`, `library.properties`, or `module.json`. It must be located in the root of a library.

We highly recommend using `library.json` for better compatibility and avoiding any issues.

#### Contents

- **Structure**
- **Manifest**
- **Publishing**
- **Examples**

#### Structure

We recommend to use `src` folder for your C/C++ source files and `include` folder for your headers. You can also have nested sub-folders in `src` or `include`.

Example

```
    ├── examples
    │     └── echo
    └── include
```

(continues on next page)
A library package must contain a manifest. We recommend using `library.json`.

**Example**

```json
{
  "name": "HelloWorld",
  "version": "1.0.0",
  "description": "A "Hello world" program is a computer program that outputs "Hello World" (or some variant) on a display device",
  "keywords": "planet, happiness, people",
  "repository": {
    "type": "git",
    "url": "https://github.com/username/hello-world.git"
  },
  "authors": [
    {
      "name": "John Smith",
      "email": "me@john-smith.com",
      "url": "https://www.john-smith/contact"
    },
    {
      "name": "Andrew Smith",
      "email": "me@andrew-smith.com",
      "url": "https://www.andrew-smith/contact",
      "maintainer": true
    }
  ],
  "license": "MIT",
  "homepage": "https://www.helloworld.org/",
  "dependencies": {
    "ownername/print": "~1.3.0"
  },
  "frameworks": "*",
  "platforms": "*"
}
```

**Publishing**

You can publish a library to the PlatformIO Registry using `pio package publish` command. Every time when you modify a source code of a library you will need to increment the “version” field in `library.json` manifest and re-publish again.

If the published library has an issue and you would like to remove it from the PlatformIO Registry, please use `pio package unpublish` command.
Examples

See the published libraries in PlatformIO Registry.

1.10 Development Platforms

The PlatformIO ecosystem has a decentralized architecture, allowing development for a range of development platforms. A development platform (or just “platform” for short) is usually a particular microcontroller or processor architecture that PlatformIO projects can be compiled to run on. (A few platforms, for example Teensy, use different target architectures for different boards.)

Each of the three supported host systems Mac OS X, Linux and Windows support compiling for all platforms listed below. Some platforms are also supported under ARM Linux hosts such as Raspberry Pi. For each development platform, PlatformIO defines:

- The PlatformIO Build System build scripts for the supported frameworks and SDKs
- Pre-configured presets for embedded circuit boards
- Pre-compiled toolchains and related tools for the architecture(s)

Each project must specify the platform name using the platform option in “platformio.ini” (Project Configuration File). A specific platform version can optionally be specified as well. As embedded boards are equipped with a particular microcontroller, each embedded board specifies what development platform it uses and this can not be changed.

If a new board uses an architecture not in this list, a custom development platform can be created; see Custom Development Platforms.

1.10.1 Embedded

Aceinna IMU

Configuration platform = aceinna imu

Open-source, embedded development platform for Aceinna IMU hardware. Run custom algorithms and navigation code on Aceinna IMU/INS hardware.

For more detailed information please visit vendor site.

Examples

Examples are listed from Aceinna IMU development platform repository:
- OpenIMU300RI
- OpenIMU330BI
- OpenRTK330LI
- OpenIMU300ZI

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - On-Board Debug Tools
  - External Debug Tools

**Tools & Debug Probes**

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

**On-Board Debug Tools**

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

<table>
<thead>
<tr>
<th>Name</th>
<th>MCU</th>
<th>Frequency</th>
<th>Flash</th>
<th>RAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aceinna Low Cost RTK</td>
<td>STM32F469NIH6</td>
<td>180MHz</td>
<td>1MB</td>
<td>384KB</td>
</tr>
</tbody>
</table>

**External Debug Tools**

Boards listed below are compatible with *Debugging* but DEPEND ON external debug probe. They ARE NOT READY for debugging. Please click on board name for the further details.

<table>
<thead>
<tr>
<th>Name</th>
<th>MCU</th>
<th>Frequency</th>
<th>Flash</th>
<th>RAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aceinna OpenIMU 300</td>

<tr>
<td>Aceinna OpenRTK330L</td>
<td>STM32F469IG</td>
<td>180MHz</td>
<td>1MB</td>
<td>384KB</td>
</tr>
</tbody>
</table>
Stable and upstream versions

You can switch between stable releases of Aceinna IMU development platform and the latest upstream version using `platform` option in “`platformio.ini`” (Project Configuration File) as described below.

### Stable

```ini
; Latest stable version
[env:latest_stable]
platform = aceinna_imu
board = ...

; Custom stable version
[env:custom_stable]
platform = aceinna_imu@x.y.z
board = ...
```

### Upstream

```ini
[env:upstream_develop]
platform = https://github.com/aceinna/platform-aceinna_imu.git
board = ...
```

### Packages

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tool-jlink</td>
<td>Software and Documentation Pack for SEGGER J-Link debug probes</td>
</tr>
<tr>
<td>tool-openocd</td>
<td>Open On-Chip Debugger. Free and Open On-Chip Debugging, In-System Programming and Boundary-Scan Testing</td>
</tr>
<tr>
<td>toolchain-gccarmnoneabi</td>
<td>GNU toolchain for Arm Cortex-M and Cortex-R processors</td>
</tr>
</tbody>
</table>

**Warning:** Linux Users:

- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article [Enable serial port on Raspberry Pi](#).

**Windows Users:**

Please check that you have a correctly installed USB driver from board manufacturer

### Boards

**Note:**

- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
For more detailed board information please scroll the tables below by horizontally.

### Aceinna

### ASR Microelectronics ASR605x

**Configuration**  
`platform = asrmicro650x`

ASR Microelectronics ASR605x series is highly integrated and ultra low power SoC based on the PSoC 4000 series MCU (ARM Cortex M0+ Core) and Semtech SX1262 transceiver.

For more detailed information please visit [vendor site](#).

**Contents**

- Configuration
- Examples
- Stable and upstream versions
- Packages
- Frameworks
- Boards

### Configuration

- **LoRaWAN**

**LoRaWAN**

LoRaWAN protocol can be configured in "platformio.ini" (`Project Configuration File`) using the following syntax:

```
board_build.arduino.lorawan.*
```

where `*` is an option from the following list:
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Possible values</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td>Device class</td>
<td>CLASS_A, CLASS_C</td>
<td>CLASS_A</td>
</tr>
<tr>
<td>netmode</td>
<td>Activation method</td>
<td>OTAA, ABP</td>
<td>OTAA</td>
</tr>
<tr>
<td>adr</td>
<td>Adaptive Data Rate</td>
<td>ON, OFF</td>
<td>ON</td>
</tr>
<tr>
<td>uplinkmode</td>
<td>Uplink confirmed/unconfirmed messages</td>
<td>CONFIRMED, UNCONFIRMED</td>
<td>CONFIRMED</td>
</tr>
<tr>
<td>net_reserve</td>
<td>Don’t rejoin after reset</td>
<td>ON, OFF</td>
<td>OFF</td>
</tr>
<tr>
<td>at_support</td>
<td>AT commands support</td>
<td>ON, OFF</td>
<td>ON</td>
</tr>
<tr>
<td>rgb</td>
<td>RGB light for LoRaWAN status</td>
<td>ACTIVE, DEACTIVE</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>debug_level</td>
<td>Print LoRaWAN relevant messages print to serial port</td>
<td>NONE, FREQ (Sending/receiving frequency), FREQ_AND_DIO (Sending/receiving frequency and DIO pin interrupt information)</td>
<td>NONE</td>
</tr>
</tbody>
</table>

Example

```Ini
[env:cubecell_board]
platform = asrmicro650x
framework = arduino
board = cubecell_board
board_build.arduino.lorawan.region = EU433
board_build.arduino.lorawan.adr = OFF
board_build.arduino.lorawan.debug_level = FREQ_AND_DIO
```

More information about LoRaWAN configuration can be found in the official CubeCell documentation.

Examples

Examples are listed from ASR Microelectronics ASR605x development platform repository:

- arduino-blink
- arduino-rgb
- arduino-adc
- LoRa
- arduino-lowpower

Stable and upstream versions

You can switch between stable releases of ASR Microelectronics ASR605x development platform and the latest upstream version using platform option in “platformio.ini” (Project Configuration File) as described below.
Stable

```plaintext
; Latest stable version
[env:latest_stable]
platform = asrmicro650x
board = ...

; Custom stable version
[env:custom_stable]
platform = asrmicro650x@x.y.z
board = ...
```

Upstream

```plaintext
[env:upstream_develop]
platform = https://github.com/HelTecAutomation/platform-asrmicro650x.git
board = ...
```

Packages

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>framework-arduinoasrmicro650x</td>
<td>Arduino Wiring-based Framework for ASR Microelectronics ASR650x (Heltec core)</td>

</tbody>
</table>

### Atmel AVR

#### Configuration

Configuration `platform = atmelavr`

Atmel AVR 8-bit MCUs deliver a unique combination of performance, power efficiency and design flexibility. Optimized to speed time to market-and easily adapt to new ones-they are based on the industry’s most code-efficient architecture for C and assembly programming.

For more detailed information please visit vendor site.

### Contents

- Configuration
- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

### Configuration

- Upload using Programmer
- Upload EEPROM data
• **Fuses programming**
  – Custom fuses
  – MiniCore, MegaCore, MightyCore, MajorCore and MicroCore
  – Overriding default fuses command

• **Bootloader programming**
  – Custom bootloader
  – Overriding default bootloader command

### Upload using Programmer

In the case of external programmers, it’s easy to brick a board simply by specifying incorrect upload flags. It’s highly recommended to use the `upload_command` option that gives the full control over flags used for uploading.

**Note:** The list of supported programmers available in avrdude is accessible via the `avrdude -c ?` command

Configuration for the programmers:

• **AVRISP**

```python
[env:program_via_AVRISP]
platform = atmelavr
framework = arduino
upload_protocol = custom
upload_port = SERIAL_PORT_HERE
upload_speed = 19200
upload_flags =
  -C
  ; use "tool-avrdude-megaavr" for the atmelmegaavr platform
$PROJECT_PACKAGES_DIR/tool-avrdude/avrdude.conf
-p
$BOARD_MCU
-p
$UPLOAD_PORT
-b
$UPLOAD_SPEED
-c
stk500v1
upload_command = avrdude $UPLOAD_FLAGS -U flash:w:$SOURCE:i
```

• **AVRISP mkII**

```python
[env:program_via_AVRISP_mkII]
platform = atmelavr
framework = arduino
upload_protocol = custom
upload_port = usb
upload_flags =
  -C

Upload EEPROM data

To upload EEPROM data (from EEMEM directive) you need to use uploadeep target instead upload for pio run --target command. For example, pio run -t uploadeep.

Fuses programming

PlatformIO has a built-in target called fuses for setting fuse bits. The default fuse bits are predefined in the board manifest file in the fuses section. For example, fuses section for Arduino Uno board. To set fuse bits you need to use target fuses with pio run --target command.

Custom fuses

Custom fuse values and upload flags (based on upload protocol) should be specified in “platformio.ini” (Project Configuration File). The lfuse and hfuse bits are mandatory, efuse is optional and not supported by all targets. An example of setting custom fuses for uno board:

```
[env:custom_fuses]
platform = atmelavr
framework = arduino
board = uno
upload_protocol = stk500v1
upload_speed = 19200
board_fuses.lfuse = 0xAA
board_fuses.hfuse = 0xBB
board_fuses.efuse = 0xCC
upload_flags =
   -PCOM15
   -b$UPLOAD_SPEED
   -e
```

MiniCore, MegaCore, MightyCore, MajorCore and MicroCore

MiniCore, MegaCore, MightyCore, MajorCore and MicroCore support dynamic fuses generation. Generated values are based on the following parameters:
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>
<td>board_build.f_cpu</td>
<td>Specifies the clock frequencies in Hz. Used to determine what oscillator option to choose. A capital L has to be added to the end of the frequency number.</td>
<td>16000000L</td>
</tr>
<tr>
<td>board_hardware.oscillator</td>
<td>Specifies which oscillator is used internal or external. Internal oscillator only works with f_cpu values 8000000L and 1000000L</td>
<td>external</td>
</tr>
<tr>
<td>board_hardware.uart</td>
<td>Specifies the hardware UART port used for serial upload. can be uart0, uart1, uart2 or uart3 depending on the target. Use no_bootloader if you're not using a bootloader for serial upload.</td>
<td>uart0</td>
</tr>
<tr>
<td>board_hardware.bod</td>
<td>Specifies the hardware brown-out detection. Use disabled to disable brown-out detection.</td>
<td>2.7v</td>
</tr>
<tr>
<td>board_hardware.eesave</td>
<td>Specifies if the EEPROM memory should be retained when uploading using a programmer. Use no to disable</td>
<td>yes</td>
</tr>
<tr>
<td>board_hardware.ckout</td>
<td>Enables system clock output on targets that have this feature. The system clock will be output on a dedicated output pin. See the target datasheet for more information. Use Yes to enable</td>
<td>no</td>
</tr>
<tr>
<td>board_hardware.jtagen</td>
<td>Enables the JTAG programming and debugging interface for targets that supports JTAG. Use yes to enable</td>
<td>no</td>
</tr>
<tr>
<td>board_hardware.cfd</td>
<td>Enables clock failure detection. Note that this feature is only available on ATmega324PB and ATmega328PB. Use yes to enable CFD</td>
<td>no</td>
</tr>
</tbody>
</table>

Valid BOD values:

<table>
<thead>
<tr>
<th>ATmega8, ATmega8515, ATmega8535/16/32, ATmega64/128</th>
<th>AT90CAN32/64/128</th>
<th>Other targets</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0v</td>
<td>4.1v</td>
<td>4.3v</td>
</tr>
<tr>
<td>2.7v</td>
<td>4.0v</td>
<td>2.7v</td>
</tr>
<tr>
<td>disabled</td>
<td>3.9v</td>
<td>1.8v</td>
</tr>
<tr>
<td></td>
<td>3.8v</td>
<td>disabled</td>
</tr>
<tr>
<td></td>
<td>2.7v</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2.6v</td>
<td></td>
</tr>
<tr>
<td></td>
<td>2.5v</td>
<td></td>
</tr>
<tr>
<td></td>
<td>disabled</td>
<td></td>
</tr>
</tbody>
</table>

Hardware configuration example:

```yaml
[env:custom_fuses]
platform = atmelavr
framework = arduino
board = ATmega32

board_build.f_cpu = 1000000L
board_hardware.uart = uart0
board_hardware.oscillator = internal
board_hardware.bod = 2.7v
board_hardware.eesave = no
upload_protocol = usbasp
```

(continues on next page)
Overriding default fuses command

PlatformIO splits the command for programming fuses in the following overridable parts:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUSESUPLOADER</td>
<td>The tool used for setting fuses</td>
<td>By default <code>avrdude</code> is used</td>
</tr>
<tr>
<td>FUSESUPLOADERFLAGS</td>
<td>General command-line options that control uploader’s behavior</td>
<td>-D, -V, -P COM1, -C <code>atmelice_isp</code>, -b 115200</td>
</tr>
<tr>
<td>FUSESFLAGS</td>
<td>A list of flags specific to fuses settings</td>
<td>-Ulock:w:0x2F:m, -Uefuse:w:0xCB:m, -Ulfuse:w:0xFF:m</td>
</tr>
<tr>
<td>SETFUSESCMD</td>
<td>Variable that holds the final command compiled from variables above</td>
<td><code>$FUSESUPLOADER</code></td>
</tr>
</tbody>
</table>

If for any reason default parameters are not suitable for your project, you can override the entire upload command or any particular part of that command using an extra script, for example, you can override only fuses values:

```python
Import("env")
env.Replace(
    FUSESFLAGS=[
        "-Uhfuse:w:0xAA:m",
        "-Uefuse:w:0xBB:m",
        "-Ulfuse:w:0xCC:m",
        "-Ulock:w:0xDD:m"
    ]
)
```

Or override a specific uploader flag:

```python
Import("env")
env.Append(
    FUSESUPLOADERFLAGS=[
        "-V",
        "-D"
    ]
)
```

It’s also possible to completely override the entire upload command:

```python
import("env")
env.Replace(
    FUSESUPLOADERFLAGS=[
        # use "tool-avrdude-megaavr" for the atmelmegaavr platform
        
        "-C", "$PROJECT_PACKAGES_DIR/tool-avrdude/avrdude.conf",
        "-p", "$BOARD_MCU",
        "-c", "atmelice_isp",
    ]
)
```
Bootloader programming

PlatformIO has a built-in target called `bootloader` for flashing bootloaders. The default bootloader image and corresponding fuse bits are predefined in the board manifest file in the `bootloader` section, for example, Arduino Uno. To upload a bootloader image you need to use target `bootloader` with `pio run --target` command.

Custom bootloader

Custom bootloader and accompanying fuses should be specified in the `platformio.ini` (Project Configuration File). If `lock_bits` and `unlock_bits` are not set then the default values 0x0F and 0x3F are used accordingly. An example of setting custom bootloader for `uno` board:

```
[env:uno]
platform = atmelavr
framework = arduino
board = uno

board_bootloader.file = /path/to/custom/bootloader.hex
board_bootloader.1fuse = 0xFF
board_bootloader.hfuse = 0xDE
board_bootloader.efuse = 0xFD
board_bootloader.lock_bits = 0x0F
board_bootloader.unlock_bits = 0x3F
```

MiniCore, MegaCore, MightyCore and MajorCore have a wide variety of precompiled bootloaders. Bootloader binaries are dynamically selected according to the hardware parameters `f_cpu`, `oscillator`, `uart` and `upload_speed`. For a complete table with all available baud rates, see the Optiboot flash repo. Here is a table with recommended baud rates for different clock frequencies:

<table>
<thead>
<tr>
<th>Frequency</th>
<th>Oscillator type</th>
<th>Recommended upload speed</th>
</tr>
</thead>
<tbody>
<tr>
<td>20000000L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>18432000L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>16000000L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>14745600L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>12000000L</td>
<td>external</td>
<td>57600</td>
</tr>
<tr>
<td>11059200L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>8000000L</td>
<td>external/internal</td>
<td>57600/38400</td>
</tr>
<tr>
<td>7372800L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>4000000L</td>
<td>external</td>
<td>9600</td>
</tr>
<tr>
<td>3686400L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>2000000L</td>
<td>external</td>
<td>9600</td>
</tr>
<tr>
<td>1843200L</td>
<td>external</td>
<td>115200</td>
</tr>
<tr>
<td>1000000L</td>
<td>external/internal</td>
<td>9600</td>
</tr>
</tbody>
</table>
Overriding default bootloader command

PlatformIO splits the command for programming bootloader in the following overridable parts:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>BOOTUPLOADER</td>
<td>The tool used for programming bootloader image</td>
<td>By default avrdude is used</td>
</tr>
<tr>
<td>BOOTUPLOADERS</td>
<td>General command-line options that control uploader’s behavior</td>
<td>-D, -V, -P COM1, -C atmelice_isp, -b 115200</td>
</tr>
<tr>
<td>BOOTFLAGS</td>
<td>A list of flags specific to bootloader settings</td>
<td>-Uflash:w:/path/to/ bootlader_image:i, -Ulock:w:0x2F:m</td>
</tr>
<tr>
<td>UPLOADBOOTCMD</td>
<td>Variable that holds the final command compiled from variables above</td>
<td>$BOOTUPLOADER $BOOTUPLOADERS $UPLOAD_FLAGS $BOOTFLAGS</td>
</tr>
</tbody>
</table>

If for any reason default parameters are not suitable for your project, you can override the entire upload command or any particular part of that command using an extra script, for example, you can override only fuses values:

```python
Import("env")
bootloader_path = "~/path/to/custom/bootloader.hex"
env.Replace(
    BOOTFLAGS=[
        "-Uflash:w:%s:i" % bootloader_path,
        "-Ulock:w:0xFF:m"
    ]
)
```

Or override a specific uploader flag:

```python
Import("env")
env.Append(
    BOOTUPLOADERSFLAGS=[
        "-e", "-p", "~/dev/cu.usbserial-1414302"
    ]
)
```

It's also possible to completely override the entire upload command:

```python
Import("env")
env.Replace(
    BOOTUPLOADERSFLAGS=[
        # use "tool-avrdude-megaavr" for the atmelmegaavr platform
        "-C", "$PROJECT_PACKAGES_DIR/tool-avrdude/avrdude.conf",
        "-p", "$BOARD_MCU",
        "-c", "atmelice_isp"
    ],
    UPLOADBOOTCMD="avrdude $BOOTUPLOADERSFLAGS -Ulock:w:0x0F:m",
)
```
Examples

Examples are listed from Atmel AVR development platform repository:

• arduino-blink
• simba-blink
• native-blink
• arduino-own-src_dir
• engduino-magnetometer
• digitstump-mouse
• arduino-internal-libs
• arduino-external-libs

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

Stable and upstream versions

You can switch between stable releases of Atmel AVR development platform and the latest upstream version using `platform` option in “platformio.ini” (Project Configuration File) as described below.

**Stable**

`; Latest stable version
[env:latest_stable]
platform = atmelavr
board = ...

`; Custom stable version
[env:custom_stable]
platform = atmelavr@x.y.z
board = ...

**Upstream**

[env:upstream_develop]
platform = https://github.com/platformio/platform-atmelavr.git
board = ...

**Warning: Linux Users:**

- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article Enable serial port on Raspberry Pi.

**Windows Users:**

Please check that you have a correctly installed USB driver from board manufacturer
Frameworks

<table>
<thead>
<tr>
<th>Name</th>

Atmel megaAVR

Configuration `platform = atmelmegaavr`
8-bit MCUs Built for Real-time Control with Core Independent Peripherals combining intelligent hardware peripherals along with the low-power capability of an AVR core, megaAVR microcontrollers (MCUs) broaden the effectiveness of your real-time control systems.

For more detailed information please visit vendor site.

Configuration

- Upload using Programmer
  - Upload using pyupdi
- Fuses programming
  - Custom fuses
  - Overriding default fuses command
- Bootloader programming
  - Custom bootloader
  - Overriding default bootloader command

Upload using Programmer

In the case of external programmers, it’s easy to brick a board simply by specifying incorrect upload flags. It’s highly recommended to use the upload_command option that gives the full control over flags used for uploading. Please read Upload using Programmer for more information.

Upload using pyupdi

pyupdi is a Python-based tool for programming tinyAVR and megaAVR devices with UPDI interface via a standard serial port. It can be installed directly in the PlatformIO virtual environment using the following command:

```
pip install https://github.com/mraardvark/pyupdi/archive/master.zip
```

Once pyupdi is installed it can be used as the uploader via a custom upload_command option, for example:
Warning: Device names used in `pyupdi` differ from MCU names used in the `atmelmegaavr` platform. Run `pyupdi --help` to see the list of supported devices.

More information and a typical circuit diagram can be found in the official `pyupdi` repository.

**Fuses programming**

PlatformIO has a built-in target called `fuses` for setting fuse bits. The default fuse bits are predefined in the board manifest file in the `fuses` section. For example, `fuses` section for Arduino Nano Every board. To set fuse bits you need to use target `fuses` with `pio run --target` command.

**Custom fuses**

Custom fuse values and upload flags (based on upload protocol) should be specified in the `platformio.ini` (Project Configuration File). An example of setting custom fuses for ATmega3209 board:

```
[env:custom_fuses]
platform = atmelmegaavr
framework = arduino
board = ATmega3209
upload_protocol = xplainedmini_updi
board_fuses.bootend = 0xAA
board_fuses.syscfg0 = 0xBB
board_fuses.osccfg = 0xCC
```

**Overriding default fuses command**

For more detailed information read `Overriding default fuses command`.

**Bootloader programming**

PlatformIO has a built-in target called `bootloader` for flashing bootloaders. The default bootloader image and corresponding fuse bits are predefined in the board manifest file in the `bootloader` section, for example, Arduino Uno WiFi Rev2. To upload a bootloader image you need to use target `bootloader` with `pio run --target` command.
Custom bootloader

Custom bootloader and accompanying fuses should be specified in “platformio.ini” (Project Configuration File). An example of setting custom bootloader for ATmega4808 board:

```
[env:ATmega4808]
platform = atmelmegaavr
framework = arduino
board = ATmega4808

board_bootloader.file = /path/to/custom/bootloader.hex
board_bootloader.bootend = 0xFF
board_bootloader.syscfg0 = 0xDE
board_bootloader.osccfg = 0xFD
board_bootloader.lock_bits = 0x0F
```

Overriding default bootloader command

For more detailed information read Overriding default bootloader command.

Examples

Examples are listed from Atmel megaAVR development platform repository:

- arduino-blink
- native-blink
- arduino-internal-libs
- arduino-external-libs

Stable and upstream versions

You can switch between stable releases of Atmel megaAVR development platform and the latest upstream version using platform option in “platformio.ini” (Project Configuration File) as described below.

Stable

```
; Latest stable version
[env:latest_stable]
platform = atmelmegaavr
board = ...

; Custom stable version
[env:custom_stable]
platform = atmelmegaavr@x.y.z
board = ...
```
Upstream

```python
[env:upstream_develop]
platform = https://github.com/platformio/platform-atmelmegaavr.git
board = ...
```

Warning: Linux Users:
- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article Enable serial port on Raspberry Pi.

Windows Users:
- Please check that you have a correctly installed USB driver from board manufacturer

### Atmel SAM

Configuration `platform = atmelsam`

1.10. Development Platforms
Atmel | SMART offers Flash- based ARM products based on the ARM Cortex-M0+, Cortex-M3 and Cortex-M4 architectures, ranging from 8KB to 2MB of Flash including a rich peripheral and feature mix.

For more detailed information please visit vendor site.

Examples are listed from Atmel SAM development platform repository:

- mbed-blink
- mbed-serial
- zephyr-blink
- zephyr-subsys-logger
- mbed-events
- arduino-blink
- simba-blink
- arduino-internal-libs
- zephyr-drivers-lcd-hd44780
- arduino-external-libs
- mbed-dsp
- arduino-web-thing-led
- arduino-brika-internal-libs

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

- Tools & Debug Probes
  - On-Board Debug Tools
  - External Debug Tools
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

External Debug Tools

Boards listed below are compatible with Debugging but **DEPEND ON** external debug probe. They **ARE NOT READY** for debugging. Please click on board name for the further details.

### Stable and upstream versions

You can switch between stable releases of Atmel SAM development platform and the latest upstream version using `platform` option in “`platformio.ini` (Project Configuration File)” as described below.

#### Stable

```ini
; Latest stable version
[env:latest_stable]
platform = atmelsam
board = ...

; Custom stable version
[env:custom_stable]
platform = atmelsam@x.y.z
board = ...
```

#### Upstream

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-atmelsam.git
board = ...
```

### Packages

</tbody>
</table>

**Warning: Linux Users:**

- Install "udev" rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article [Enable serial port on Raspberry Pi](#).

**Windows Users:**

Please check that you have a correctly installed USB driver from board manufacturer.
Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td>Mbed</td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices</td>
</tr>
<tr>
<td>Simba</td>
<td>Simba is an RTOS and build framework with aims to make embedded programming easy and portable</td>
</tr>
<tr>
<td>Zephyr RTOS</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>
</tbody>
</table>

Boards

Note:

- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

CHIPS Alliance

**Configuration**  
`platform = chipsalliance`

The CHIPS Alliance develops high-quality, open source hardware designs relevant to silicon devices and FPGAs. For more detailed information please visit vendor site.

Contents

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

Examples

Examples are listed from CHIPS Alliance development platform repository:

- native-blink_asm
- native-bare_c
- rtosal-freertos
- native asm
- zephyr-hello-world
- psp-hello-world
Debugging

"1-click" solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - **On-Board Debug Tools**

**Tools & Debug Probes**

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (*Project Configuration File*).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

**On-Board Debug Tools**

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

<table>
<thead>
<tr>
<th>Name</th>
<th>MCU</th>
<th>Frequency</th>

<th>RAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>RVfpga: Digilent Nexys A7</td>
<td>320MHz</td>
<td>16MB</td>
<td>1.16MB</td>
<td></td>
</tr>
</tbody>
</table>

**Stable and upstream versions**

You can switch between stable releases of CHIPS Alliance development platform and the latest upstream version using `platform` option in “platformio.ini” (*Project Configuration File*) as described below.

**Stable**

```ini
; Latest stable version
[env:latest_stable]
platform = chipsalliance
board = ...

; Custom stable version
[env:custom_stable]
platform = chipsalliance@x.y.z
board = ...
```
Upstream

[env:upstream_develop]
platform = https://github.com/platformio/platform-chipsalliance.git
board = ...

</tbody>
</table>
**Warning:** Linux Users:
- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article [Enable serial port on Raspberry Pi](#).

**Windows Users:**
Please check that you have a correctly installed USB driver from board manufacturer.

---

### Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>FreeRTOS</strong></td>
<td>FreeRTOS is a real-time operating system kernel for embedded devices that has been ported to 40 microcontroller platforms</td>
</tr>
<tr>
<td><strong>WD-Firmware</strong></td>
<td>The WD Firmware package contains firmware applications and Processor Support Package (PSP) for various cores, alongside demos which support all features</td>
</tr>
<tr>
<td><strong>Zephyr RTOS</strong></td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>
</tbody>
</table>

### Boards

Note:
- You can list pre-configured boards by `pio boards` command or [PlatformIO Boards Explorer](#).
- For more detailed board information please scroll the tables below by horizontally.

---

#### Digilent

<table>
<thead>
<tr>

• FLASH Frequency
• FLASH Mode
• External RAM (PSRAM)
• Debug Level
• Upload Speed
• Erase Flash
• Partition Tables
• Embedding Binary Data
• uploading files to file system SPIFFS
• Over-the-Air (OTA) update
  – Using JFrog Bintray (free and secure Cloud solution)
  – Using built-in Local solution
    * Authentication and upload options
• Using Arduino Framework with Staging version
• Arduino Core Wiki

CPU Frequency

See board_build.f_cpu option from “platformio.ini” (Project Configuration File)
FLASH Frequency

Please use `board_build.f_flash` option from "platformio.ini" (Project Configuration File) to change a value. Possible values:

- 40000000L (default)
- 80000000L

FLASH Mode

Flash chip interface mode. This parameter is stored in the binary image header, along with the flash size and flash frequency. The ROM bootloader in the ESP chip uses the value of these parameters in order to know how to talk to the flash chip.

Please use `board_build.flash_mode` option from "platformio.ini" (Project Configuration File) to change a value. Possible values:

- qio
- qout
- dio
- dout

External RAM (PSRAM)

You can enable external RAM using the next extra `build_flags` in "platformio.ini" (Project Configuration File) depending on a framework type.

Framework Arduino:

```ini
[env:myenv]
platform = espressif32
framework = arduino
board = ...
build_flags =
   -DBOARD_HAS_PSRAM
   -mfix-esp32-psram-cache-issue
```

Framework Espressif IoT Development Framework:
More details are located in the official ESP-IDF documentation - Support for external RAM.

**Debug Level**

Please use one of the next `build_flags` to change debug level. A `build_flags` option could be used only the one time per build environment. If you need to specify more flags, please separate them with a new line or space.

Actual information is available in Arduino for ESP32 Board Manifest. Please scroll to `esp32.menu.DebugLevel` section.

```ini
[env:myenv]
platform = espressif32
framework = espidf
board = ...
build_flags =
    -DCONFIG_SPIRAM_CACHE_WORKAROUND
```

```ini
[env:myenv]
platform = ...
board = ...
framework = arduino

;;;;; Possible options ;;;;;;

// None
build_flags = -DCORE_DEBUG_LEVEL=0

// Error
build_flags = -DCORE_DEBUG_LEVEL=1

// Warn
build_flags = -DCORE_DEBUG_LEVEL=2

// Info
build_flags = -DCORE_DEBUG_LEVEL=3

// Debug
build_flags = -DCORE_DEBUG_LEVEL=4

// Verbose
build_flags = -DCORE_DEBUG_LEVEL=5
```

**Upload Speed**

You can set custom upload speed using `upload_speed` option from “platformio.ini” (Project Configuration File)

```ini
[env:myenv]
upload_speed = 9600
```

**Erase Flash**

Please `pio run --target` the next command to erase the entire flash chip (all data replaced with 0xFF bytes):
> pio run --target erase
# or short version
> pio run -t erase

Partition Tables

You can create a custom partitions table (CSV) following ESP32 Partition Tables documentation. PlatformIO uses default partition tables depending on a framework type:
- `default.csv` for Arduino (show pre-configured partition tables)
- `partitions_singleapp.csv` for Espressif IoT Development Framework (show pre-configured partition tables)

To override default table please use `board_build.partitions` option in "platformio.ini" (Project Configuration File).

**Warning:** SPIFFS partition MUST have configured “Type” as “data” and “SubType” as “spiffs”. For example, `spiffs, data, spiffs, 0x291000, 1M`,

Examples:

```plaintext
; 1) A "partitions_custom.csv" in the root of project directory
[env:custom_table]
board_build.partitions = partitions_custom.csv

; 2) Switch between built-in tables
; https://github.com/espressif/arduino-esp32/tree/master/tools/partitions
; https://github.com/espressif/esp-idf/tree/master/components/partition_table
[env:custom_builtin_table]
board_build.partitions = no_ota.csv
```

Embedding Binary Data

Sometimes you have a file with some binary or text data that you’d like to make available to your program - but you don’t want to reformat the file as C source.

There are two options `board_build.embed_txtfiles` and `board_build.embed_files` which can be used for embedding data. The only difference is that files specified in `board_build.embed_txtfiles` option are null-terminated in the final binary.

```plaintext
[env:myenv]
platform = espressif32
board = ...
board_build.embed_txtfiles =
  src/private.pem.key
  src/certificate.pem.crt
  src/aws-root-ca.pem
```

The file contents will be added to the .rodata section in flash, and are available via symbol names as follows:
extern const uint8_t aws_root_ca_pem_start[] asm("_binary_src_aws_root_ca_pem_start");
extern const uint8_t aws_root_ca_pem_end[] asm("_binary_src_aws_root_ca_pem_end");
extern const uint8_t certificate_pem_crt_start[] asm("_binary_src_certificate_pem_crt_start");
extern const uint8_t certificate_pem_crt_end[] asm("_binary_src_certificate_pem_crt_end");
extern const uint8_t private_pem_key_start[] asm("_binary_src_private_pem_key_start");
extern const uint8_t private_pem_key_end[] asm("_binary_src_private_pem_key_end");

The names are generated from the full name of the file. Characters /, ., etc. are replaced with underscores. The _binary + _nested_folder prefix in the symbol name is added by “objcopy” and is the same for both text and binary files.

Note: With the ESP-IDF framework symbol names should not contain path to the files, for example _binary_private_pem_key_start instead of _binary_src_private_pem_key_start.

See full example with embedding Amazon AWS certificates:

- https://github.com/platformio/platform-espressif32/tree/develop/examples/espidf-aws-iot

Uploading files to file system SPIFFS

1. Create new project using PlatformIO IDE or initialize project using PlatformIO Core (CLI) and pio project init (if you have not initialized it yet)
2. Create data folder (it should be on the same level as src folder) and put files here. Also, you can specify own location for data_dir
3. Run “Upload File System image” task in PlatformIO IDE or use PlatformIO Core (CLI) and pio run --target command with uploadfs target.

To upload SPIFFS image using OTA update please specify upload_port / --upload-port as IP address or mDNS host name (ending with the *.local).

Examples:

- SPIFFS for Arduino
- SPIFFS for ESP-IDF

Over-the-Air (OTA) update

Using JFrog Bintray (free and secure Cloud solution)

- Video and presentation - swampUP: Over-The-Air (OTA) firmware upgrades for Internet of Things devices with PlatformIO and JFrog Bintray
- Demo source code: https://github.com/platformio/bintray-secure-ota

Using built-in Local solution

Demo code for:

- Arduino
• ESP-IDF

There are 2 options:

• Directly specify `pio run --upload-port` in command line

```
pio run --target upload --upload-port IP_ADDRESS_HERE or mDNS_NAME.local
```

• Specify `upload_port` option in “`platformio.ini`” (Project Configuration File)

You also need to set `upload_protocol` to `espota`.

```
[env:myenv]
upload_protocol = espota
upload_port = IP_ADDRESS_HERE or mDNS_NAME.local
```

For example,

• `pio run -t upload --upload-port 192.168.0.255`
• `pio run -t upload --upload-port myesp8266.local`

Authentication and upload options

You can pass additional options/flags to OTA uploader using `upload_flags` option in “`platformio.ini`” (Project Configuration File)

```
[env:myenv]
upload_protocol = espota
; each flag in a new line
upload_flags =
    --port=3232
```

Available flags

- `--port=ESP_PORT` ESP32 OTA Port. **Default 8266**
- `--auth=AUTH` Set authentication password
- `--spiffs` Use this option to transmit a SPIFFS image and do not flash the module

For the full list with available options please run

```
~/.platformio/packages/framework-arduinoespressif32/tools/espota.py --help
```

Usage: espota.py [options]

Transmit image over the air to the esp32 module with OTA support.

Options:

- `-h, --help` show this help message and exit

Destination:

- `-i ESP_IP, --ip=ESP_IP` ESP32 IP Address.
- `-I HOST_IP, --host_ip=HOST_IP` Host IP Address.
- `-p ESP_PORT, --port=ESP_PORT` ESP32 ota Port. Default **3232**
- `-P HOST_PORT, --host_port=HOST_PORT`

(continues on next page)
Host server ota Port. Default random 10000-60000

Authentication:
-a AUTH, --auth=AUTH
Set authentication password.

Image:
-f FILE, --file=FILE
Image file.
-s, --spiffs Use this option to transmit a SPIFFS image and do not flash the module.

Output:
-d, --debug Show debug output. And override loglevel with debug.
-r, --progress Show progress output. Does not work for ArduinoIDE
-t TIMEOUT, --timeout=TIMEOUT Timeout to wait for the ESP32 to accept invitation

Warning: For windows users. To manage OTA check the ESP wifi network profile isn’t checked on public be sure it’s on private mode’’

Using Arduino Framework with Staging version

PlatformIO will install the latest Arduino Core for ESP32 from https://github.com/espressif/arduino-esp32. The Git should be installed in a system. To update Arduino Core to the latest revision, please open PlatformIO IDE and navigate to PlatformIO Home > Platforms > Updates.

1. Please install PlatformIO IDE
2. Initialize a new project, open “platformio.ini” (Project Configuration File) and specify the link to the framework repository in platform_packages section. For example,

```
[env:esp32dev]
platform = espressif32
board = esp32dev
framework = arduino
platform_packages =
    platformio/framework-arduinospressif32 @ https://github.com/espressif/arduino-esp32.git
```
3. Try to build the project
4. If you see build errors, then try to build this project using the same stage with Arduino IDE
5. If it works with Arduino IDE but doesn’t work with PlatformIO, then please file a new issue with attached information:
   - test project/files
   - detailed log of build process from Arduino IDE (please copy it from console to https://hastebin.com)
   - detailed log of build process from PlatformIO Build System (please copy it from console to https://hastebin.com)
Arduino Core Wiki

Examples

Examples are listed from Espressif 32 development platform repository:

- espidf-storage-sdcard
- espidf-blink
- espidf-coap-server
- espidf-exceptions
- arduino-blink
- simba-blink
- espidf-ble-eddystone
- espidf-ulp-adc
- espidf-ulp-pulse
- espidf-arduino-wifiscan
- espidf-http-request
- espidf-arduino-blink
- pumbaa-blink
- espidf-hello-world
- espidf-aws-iot
- arduino-briki-internal-libs
- espidf-peripherals-uart
- arduino-wifiscan

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

<table>
<thead>
<tr>

Stable and upstream versions

You can switch between stable releases of Espressif 32 development platform and the latest upstream version using `platform` option in “platformio.ini” (Project Configuration File) as described below.

Stable

```ini
; Latest stable version
[env:latest_stable]
platform = espressif32
board = ...

; Custom stable version
[env:custom_stable]
platform = espressif32@x.y.z
board = ...
```

Upstream

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-espressif32.git
board = ...
```
## Packages

</table>

**Warning: Linux Users:**

- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article Enable serial port on Raspberry Pi.

**Windows Users:**

Please check that you have a correctly installed USB driver from board manufacturer

## Frameworks

Espressif 8266

Configuration `platform = espressif8266`

Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.

For more detailed information please visit vendor site.

• Over-the-Air (OTA) update
  – Authentication and upload options
• Demo
• Using Arduino Framework with Staging version

CPU Frequency

See board_build.f_cpu option from “platformio.ini” (Project Configuration File)

```
[env:myenv]
; set frequency to 160MHz
board_build.f_cpu = 160000000L
```

FLASH Frequency

Please use board_build.f_flash option from “platformio.ini” (Project Configuration File) to change a value. Possible values:

- 20000000L
- 26000000L
- 40000000L (default)
- 80000000L

```
[env:myenv]
; set frequency to 80MHz
board_build.f_flash = 80000000L
```

FLASH Mode

Flash chip interface mode. This parameter is stored in the binary image header, along with the flash size and flash frequency. The ROM bootloader in the ESP chip uses the value of these parameters in order to know how to talk to the flash chip.

Please use board_build.flash_mode option from “platformio.ini” (Project Configuration File) to change a value. Possible values:
• qio
• qout
• dio
• dout

```
[env:myenv]
board_build.flash_mode = qio
```

**Reset Method**

You can set custom reset method using `upload_resetmethod` option from “`platformio.ini`” (Project Configuration File).

The possible values are:

- **ck** - RTS controls RESET or CH_PD, DTR controls GPIO0
- **wifio** - TXD controls GPIO0 via PNP transistor and DTR controls RESET via a capacitor
- **nodemcu** - GPIO0 and RESET controlled using two NPN transistors as in NodeMCU devkit.

See default reset methods per board.

```
[env:myenv]
upload_resetmethod = ck
```

**Flash Size**

**Warning:** Please make sure to read ESP8266 Flash layout information first.

Available LD-scripts: https://github.com/esp8266/Arduino/tree/master/tools/sdk/ld

Please open `eagle.flash.***.ld` file to check how flash is split.

To override default LD script please use `board_build.ldscript` option from “`platformio.ini`” (Project Configuration File).

```
[env:myenv]
board_build.ldscript = eagle.flash.4m.ld
```

**Upload Speed**

You can set custom upload speed using `upload_speed` option from “`platformio.ini`” (Project Configuration File)

```
[env:myenv]
upload_speed = 9600
```

**lwIP Variant**

Available variants (macros):
• `-D PIO_FRAMEWORK_ARDUINO_LWIP2_LOW_MEMORY` v2 Lower Memory (default)
• `-D PIO_FRAMEWORK_ARDUINO_LWIP2_HIGHER_BANDWIDTH` v2 Higher Bandwidth
• `-D PIO_FRAMEWORK_ARDUINO_LWIP2_LOW_MEMORY_LOW_FLASH` v2 Lower Memory (no features)
• `-D PIO_FRAMEWORK_ARDUINO_LWIP2_HIGHER_BANDWIDTH_LOW_FLASH` v2 Higher Bandwidth (no features)
• `-D PIO_FRAMEWORK_ARDUINO_LWIP2_IPV6_LOW_MEMORY` v2 IPv6 Lower Memory
• `-D PIO_FRAMEWORK_ARDUINO_LWIP2_IPV6_HIGHER_BANDWIDTH` v2 IPv6 Higher Bandwidth
• `-D PIO_FRAMEWORK_ARDUINO_LWIP_HIGHER_BANDWIDTH` v1.4 Higher Bandwidth

You can change lwIP Variant by passing a custom macro using project `build_flags`.

For example, to switch to lwIP v1.4

```bash
[env:myenv]
...
build_flags = -D PIO_FRAMEWORK_ARDUINO_LWIP_HIGHER_BANDWIDTH
```

### SDK Version

Available versions (macros):

• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK3` NonOS SDK-pre-3.0 as of Jun 26, 2018
• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK221` NonOS SDK v2.2.1 (legacy) as of Jun 8, 2018
• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK22x_190313` NonOS SDK v2.2.x branch as of Mar 13, 2019
• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK22x_190703` NonOS SDK v2.2.x branch as of Jul 03, 2019 (default)
• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK22x_191024` NonOS SDK v2.2.x branch as of Oct 24, 2019
• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK22x_191105` NonOS SDK v2.2.x branch as of to Nov 05, 2019
• `-D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK22x_191122` NonOS SDK v2.2.x branch as of to Nov 22, 2019

You can change SDK version by passing a custom macro using project `build_flags`.

For example, to switch to SDK-pre-3.0:

```bash
[env:myenv]
...
build_flags = -D PIO_FRAMEWORK_ARDUINO_ESPRESSIF_SDK3
```

### SSL Support

By default, all SSL ciphers (most compatible) are supported.

You can control SSL support passing a custom macro using project `build_flags`.

For example, use basic SSL ciphers (lower ROM use):
Serial Debug

Please use the next `build_flags` to enable Serial debug:

```plaintext
[env:myenv]
...
build_flags = -D DEBUG_ESP_PORT=Serial
; or for Serial1
build_flags = -D DEBUG_ESP_PORT=Serial1
```

Debug Level

Please use one of the next `build_flags` to change debug level. A `build_flags` option could be used only the one time per build environment. If you need to specify more flags, please separate them with a new line or space.

Also, please note that you will need to extend `build_flags` with `Serial Debug` macro. For example, `build_flags = -D DEBUG_ESP_PORT=Serial -D DEBUG_ESP_SSL ...`

Actual information is available in Arduino for ESP8266 Board Manifest. Please scroll to `generic.menu.lvl` section.

```plaintext
[env:myenv]
platform = ...
board = ...
framework = arduino

;;;;; Possible options ;;;;;

; SSL
build_flags = -D DEBUG_ESP_SSL

; TLS_MEM
build_flags = -D DEBUG_ESP_TLS_MEM

; HTTP_CLIENT
build_flags = -D DEBUG_ESP_HTTP_CLIENT

; HTTP_SERVER
build_flags = -D DEBUG_ESP_HTTP_SERVER

; SSL+TLS_MEM
build_flags =
  -D DEBUG_ESP_SSL
  -D DEBUG_ESP_TLS_MEM

; SSL+HTTP_CLIENT
build_flags =
  -D DEBUG_ESP_SSL
  -D DEBUG_ESP_HTTP_CLIENT
```

(continues on next page)
; SSL+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_SSL
  -DDEBUG_ESP_HTTP_SERVER

; TLS_MEM+HTTP_CLIENT
build_flags =
  -DDEBUG_ESP_TLS_MEM
  -DDEBUG_ESP_HTTP_CLIENT

; TLS_MEM+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_TLS_MEM
  -DDEBUG_ESP_HTTP_SERVER

; HTTP_CLIENT+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_HTTP_CLIENT
  -DDEBUG_ESP_HTTP_SERVER

; SSL+TLS_MEM+HTTP_CLIENT
build_flags =
  -DDEBUG_ESP_SSL
  -DDEBUG_ESP_TLS_MEM
  -DDEBUG_ESP_HTTP_CLIENT

; SSL+TLS_MEM+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_SSL
  -DDEBUG_ESP_TLS_MEM
  -DDEBUG_ESP_HTTP_SERVER

; SSL+HTTP_CLIENT+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_SSL
  -DDEBUG_ESP_HTTP_CLIENT
  -DDEBUG_ESP_HTTP_SERVER

; TLS_MEM+HTTP_CLIENT+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_TLS_MEM
  -DDEBUG_ESP_HTTP_CLIENT
  -DDEBUG_ESP_HTTP_SERVER

; SSL+TLS_MEM+HTTP_CLIENT+HTTP_SERVER
build_flags =
  -DDEBUG_ESP_SSL
  -DDEBUG_ESP_TLS_MEM
  -DDEBUG_ESP_HTTP_CLIENT
  -DDEBUG_ESP_HTTP_SERVER

; CORE
build_flags = -DDEBUG_ESP_CORE

; WIFI
build_flags = -DDEBUG_ESP_WIFI
VTables

Please use one of the next `build_flags`:

```sh
[env:myenv]
...

; Flash (default)
build_flags = -DVTABLES_IN_FLASH

; Heap
build_flags = -DVTABLES_IN_DRAM

; IRAM
build_flags = -DVTABLES_IN_IRAM
```
Exceptions

Exceptions are disabled by default. To enable exceptions, use the following build_flags and build_unflags:

```plaintext
[env:myenv]
...
; Remove default exceptions disabled flag
build_unflags = -fno-exceptions
; Enable exceptions
build_flags = -fexceptions
```

Using Filesystem

Selecting appropriate Filesystem

There are two file systems for utilizing the on-board flash on the ESP8266: SPIFFS and LittleFS. They provide a compatible API but have incompatible on-flash implementations, so it is important to choose one or the per project as attempting to mount a SPIFFS volume under LittleFS may result in a format operation and definitely will not preserve any files, and vice-versa.

**Warning:** SPIFFS is currently deprecated and may be removed in future releases of the core. Please consider moving your code to LittleFS.

The SPIFFS file system is used by default in order to keep legacy project compatible. To choose LittleFS as the file system, it should be explicitly specified using board_build.filesystem option in “platformio.ini” (Project Configuration File), for example:

```plaintext
[env:myenv]
platform = espressif8266
framework = arduino
board = ...
board_build.filesystem = littlefs
```

More information about pros and cons of each file system can be found in the official documentation.

Uploading files to Filesystem

**Warning:** Please make sure to read ESP8266 Flash layout information first.

1. Create new project using PlatformIO IDE or initialize project using PlatformIO Core (CLI) and pio project init (if you have not initialized it yet)
2. Create data folder (it should be on the same level as src folder) and put files here. Also, you can specify own location for data_dir
3. Run “Upload File System image” task in PlatformIO IDE or use PlatformIO Core (CLI) and pio run --target command with uploadfs target.
To upload file system image using OTA update please specify `upload_port` as IP address or mDNS host name (ending with the `*.local`). For the details please follow to Over-the-Air (OTA) update.

By default, will be used default LD Script for the board where is specified file system offsets (start, end, page, block). You can override it using `Flash Size`.

Active discussion is located in issue #382.

**Overriding Filesystem image name**

By default, the image file name is set according to the used file system: `spiffs.bin` or `littlefs.bin`. You can change the file name using a PRE extra script, for example:

```plaintext
[env:d1]
platform = espressif8266
framework = arduino
board = d1
board_build.filesystem = littlefs
extra_scripts =
    pre:extra_script.py
```

Where a special variable `ESP8266_FS_IMAGE_NAME` can be overridden:

```python
import("env")
env.Replace(ESP8266_FS_IMAGE_NAME="custom_image_name")
```

**Over-the-Air (OTA) update**

Firstly, please read What is OTA? How to use it?

There are 2 options:

- Directly specify `pio run --upload-port` in command line

  ```bash
  pio run --target upload --upload-port IP_ADDRESS_HERE or mDNS_NAME.local
  ```

- Specify `upload_port` option in "`platformio.ini`" (Project Configuration File)

  You also need to set `upload_protocol` to `espota`.

  ```plaintext
  [env:myenv]
  upload_protocol = espota
  upload_port = IP_ADDRESS_HERE or mDNS_NAME.local
  ```

For example,

- `pio run -t upload --upload-port 192.168.0.255`
- `pio run -t upload --upload-port myesp8266.local`

**Authentication and upload options**

You can pass additional options/flags to OTA uploader using `upload_flags` option in "`platformio.ini`" (Project Configuration File)
Available flags

- `--port=ESP_PORT` ESP8266 OTA Port. Default 8266
- `--auth=AUTH` Set authentication password
- `--spiffs` Use this option to transmit a SPIFFS image and do not flash the module

For the full list with available options please run

```bash
~/.platformio/packages/framework-arduinoespressif8266/tools/espota.py --help
```

Usage: espota.py [options]

Transmit image over the air to the esp8266 module with OTA support.

Options:

- `-h, --help` show this help message and exit

Destination:

- `-i ESP_IP, --ip=ESP_IP` ESP8266 IP Address.
- `-I HOST_IP, --host_ip=HOST_IP` Host IP Address.
- `-p ESP_PORT, --port=ESP_PORT` ESP8266 ota Port. Default 8266
- `-P HOST_PORT, --host_port=HOST_PORT` Host server ota Port. Default random 10000-60000

Authentication:

- `-a AUTH, --auth=AUTH` Set authentication password.

Image:

- `-f FILE, --file=FILE` Image file.
- `-s, --spiffs` Use this option to transmit a SPIFFS image and do not flash the module.

Output:

- `-d, --debug` Show debug output. And override loglevel with debug.
- `-r, --progress` Show progress output. Does not work for ArduinoIDE
Demo

Using Arduino Framework with Staging version

PlatformIO will install the latest Arduino Core for ESP8266 from https://github.com/esp8266/Arduino. The Git should be installed in a system. To update Arduino Core to the latest revision, please open PlatformIO IDE and navigate to PlatformIO Home > Platforms > Updates.

1. Please install PlatformIO IDE

2. Initialize a new project, open “platformio.ini” (Project Configuration File) and specify the link to the framework repository in platform_packages section. For example,

   ```ini
   [env:nodemcuv2]
   platform = espressif8266
   board = nodemcuv2
   framework = arduino
   platform_packages =
   platformio/framework-arduinosoph8266 @ https://github.com/esp8266/Arduino.git
   ```

3. Try to build the project

4. If you see build errors, then try to build this project using the same stage with Arduino IDE

5. If it works with Arduino IDE but doesn’t work with PlatformIO, then please file a new issue with attached information:
   - test project/files
   - detailed log of build process from Arduino IDE (please copy it from console to https://hastebin.com)
   - detailed log of build process from PlatformIO Build System (please copy it from console to https://hastebin.com)
Examples

Examples are listed from Espressif 8266 development platform repository:

- arduino-webserver
- arduino-asyncudp
- arduino-blink
- simba-blink
- esp8266-RTOS-sdk-blink
- esp8266-nonos-sdk-blink
- arduino-wifiscan

Stable and upstream versions

You can switch between stable releases of Espressif 8266 development platform and the latest upstream version using `platform` option in “platformio.ini” (Project Configuration File) as described below.

Stable

```ini
; Latest stable version
[env:latest_stable]
platform = espressif8266
board = ...

; Custom stable version
[env:custom_stable]
platform = espressif8266@x.y.z
board = ...
```

Upstream

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-espressif8266.git
board = ...
```

**Freescale Kinetis**

Configuration `platform = freescalekinetis`

Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.

For more detailed information please visit vendor site.

**Contents**

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

---

**Examples**

Examples are listed from Freescale Kinetis development platform repository:

- zephyr-blink
- zephyr-net-telnet
- mbed-rtos-usb-msd
- zephyr-sensor-sx9500
- mbed-rtos-blink-baremetal
- mbed-rtos-ethernet-tls
- mbed-rtos-psa
- mbed-legacy-examples
- mbed-rtos-kvstore
Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - **On-Board Debug Tools**
  - **External Debug Tools**

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Stable and upstream versions**

You can switch between stable releases of Freescale Kinetis development platform and the latest upstream version using `platform` option in "platformio.ini" *(Project Configuration File)* as described below.

**Stable**

```ini
; Latest stable version
[env:latest_stable]
platform = freescalekinetis
board = ...

; Custom stable version
[env:custom_stable]
platform = freescalekinetis@x.y.z
board = ...
```

**Upstream**

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-freescalekinetis.git
board = ...
```

GigaDevice GD32V

**Configuration** `platform = gd32v`

The GigaDevice GD32V device is a 32-bit general-purpose microcontroller based on the RISC-V core with an impressive balance of processing power, reduced power consumption and peripheral set.

For more detailed information please visit vendor site.

**Contents**

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

**Examples**

Examples are listed from GigaDevice GD32V development platform repository:

- eval-blink
- arduino-blink
- longan-nano-blink

**Debugging**

Debugging - “1-click” solution for debugging with a zero configuration.

- Tools & Debug Probes
  - External Debug Tools
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

External Debug Tools

Boards listed below are compatible with Debugging but DEPEND ON external debug probe. They ARE NOT READY for debugging. Please click on board name for the further details.

Infineon XMC

Configuration \textit{platform} = \texttt{infineonxmc}

Infineon has designed the XMC microcontrollers for real-time critical applications with an industry-standard core. The XMC microcontrollers can be integrated with the Arduino platform.

For more detailed information please visit \texttt{vendor site}.

Contents

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

Examples

Examples are listed from Infineon XMC development platform repository:

- ifx9201
- device-control
- arduino-blink
- spi
- ultrasonic
- rtc
- radar
- arduino-wire

Debugging

\textit{Debugging} - “1-click” solution for debugging with a zero configuration.
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

Lattice iCE40

**Configuration**  
`platform = lattice_ice40`

The iCE40 family of ultra-low power, non-volatile FPGAs has five devices with densities ranging from 384 to 7680 Look-Up Tables (LUTs). In addition to LUT-based, low-cost programmable logic, these devices feature Embedded Block RAM (EBR), Non-volatile Configuration Memory (NVCM) and Phase Locked Loops (PLLs). These features allow the devices to be used in low-cost, high-volume consumer and system applications.

For more detailed information please visit [vendor site](#).

**Contents**

- Examples
- Stable and upstream versions
- Packages
- Boards

**Examples**

Examples are listed from Lattice iCE40 development platform repository:

- leds
- counter

**Stable and upstream versions**

You can switch between stable releases of Lattice iCE40 development platform and the latest upstream version using `platform` option in “`platformio.ini`” (Project Configuration File) as described below.

**Stable**

```
; Latest stable version
[env:latest_stable]
platform = lattice_ice40
board = ...
```
Custom stable version

```
[env:custom_stable]
platform = lattice_ice40@x.y.z
board = ...
```

Upstream

```
[env:upstream_develop]
platform = https://github.com/platformio/platform-lattice_ice40.git
board = ...
```

Maxim 32

**Configuration** \( \text{platform} = \text{maxim32} \)

Maxim’s microcontrollers provide low-power, efficient, and secure solutions for challenging embedded applications. Maxim’s processors embed cutting-edge technologies to secure data and intellectual property, proven analog circuitry for real-world applications, and battery-conserving low power operation.

For more detailed information please visit [vendor site](#).

### Nordic nRF51

**Configuration** $platform = \text{nordicnrf51}$

The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.

For more detailed information please visit vendor site.

### Examples

Examples are listed from Nordic nRF51 development platform repository:

- mbed-blink
- mbed-serial
- zephyr-blink
- mbed-events
- arduino-blink
- arduino-ble-led
- zephyr-ble-eddystone
- arduino-internal-libs
- zephyr-drivers-entropy
- mbed-ble-thermometer

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

### On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

**Stable and upstream versions**

You can switch between stable releases of Nordic nRF51 development platform and the latest upstream version using `platform` option in “`platformio.ini`” (Project Configuration File) as described below.

**Stable**

```ini
; Latest stable version
[env:latest_stable]
platform = nordicnrf51
board = ...

; Custom stable version
[env:custom_stable]
platform = nordicnrf51@x.y.z
board = ...
```

**Upstream**

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-nordicnrf51.git
board = ...
```

#### Warning: Linux Users:
- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article Enable serial port on Raspberry Pi.

#### Windows Users:
Please check that you have a correctly installed USB driver from board manufacturer

### Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td><strong>Arduino</strong> Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td>Mbed</td>
<td><strong>Mbed</strong> Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices</td>
</tr>
<tr>
<td>Zephyr</td>
<td><strong>Zephyr</strong> The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>
</tbody>
</table>

### Boards

**Note:**
- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
For more detailed board information please scroll the tables below by horizontally.

**Nordic nRF52**

Configuration `platform = nordicnrf52`

The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.

For more detailed information please visit vendor site.

### Contents

- **Tutorials**
- **Examples**
- **Debugging**
- **Stable and upstream versions**
- **Packages**
- **Frameworks**
- **Boards**

### Tutorials

- Arduino and Nordic nRF52-DK: debugging and unit testing
- Zephyr and Nordic nRF52-DK: debugging, unit testing, project analysis

### Examples

Examples are listed from Nordic nRF52 development platform repository:

- zephyr-blink
- zephyr-net-echo-client
- arduino-blink
- arduino-ble-led
- mbed-rtos-blink-baremetal
- zephyr-ble-beacon
- zephyr-subsys-nvs
- mbed-rtos-nfc
- mbed-legacy-examples
- arduino-nina-b1-generic-example
- arduino-bluefruit-bleuart
- arduino-serial-plotter
- mbed-rtos-ble-thermometer

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - On-Board Debug Tools
  - External Debug Tools

**Tools & Debug Probes**

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (*Project Configuration File*).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

**On-Board Debug Tools**

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

Stable and upstream versions

You can switch between stable releases of Nordic nRF52 development platform and the latest upstream version using `platform` option in “platformio.ini” (Project Configuration File) as described below.

**Stable**

```ini
; Latest stable version
[env:latest_stable]
platform = nordicnrf52
board = ...

; Custom stable version
[env:custom_stable]
platform = nordicnrf52@x.y.z
board = ...
```

**Upstream**

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-nordicnrf52.git
board = ...
```

**Warning: Linux Users:**
- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article [Enable serial port on Raspberry Pi](https://www.platformio.org/docs/boards/raspberry-pi.html).

**Windows Users:**
Please check that you have a correctly installed USB driver from board manufacturer

### Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences</td>
</tr>
<tr>
<td>Mbed</td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the “things” in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices</td>
</tr>
<tr>
<td>Zephyr RTOS</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind</td>
</tr>
</tbody>
</table>

### Boards

**Note:**
- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

**Nuclei**

Configuration _platform_ = _nuclei_

Find professional RISC-V Processor IP in Nuclei, first professional RISC-V IP company in Mainland China, match all your requirements in AIoT Era.

For more detailed information please visit vendor site.

**Contents**

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

**Examples**

Examples are listed from Nuclei development platform repository:

- freertos_demo
- rtthread_demo
- demo_dsp
- helloworld
- dhrystone
- whetstone
- demo_eclic
- ucosii_demo
- coremark
- demo_timer

1.10. Development Platforms 455
Debugging

- rtthread_msh
- demo_nice

Debugging - “1-click” solution for debugging with a zero configuration.

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

<table>
<thead>
<tr>
<th>Name</th>
<th>MCU</th>
<th>Frequency</th>
<th>Flash</th>
<th>RAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>GD32VF103V RVStar Kit</td>
<td>GD32VF103VBT6</td>
<td>108MHz</td>
<td>128KB</td>
<td>32KB</td>
</tr>
<tr>
<td>HummingBird Evaluation Kit</td>
<td>HUMMINGBIRD</td>
<td>5MHz</td>
<td>64KB</td>
<td>64KB</td>
</tr>
</tbody>
</table>

External Debug Tools

Boards listed below are compatible with Debugging but DEPEND ON external debug probe. They ARE NOT READY for debugging. Please click on board name for the further details.

<table>
<thead>
<tr>
<th>Name</th>
<th>MCU</th>
<th>Frequency</th>
<th>Flash</th>
<th>RAM</th>
</tr>
</thead>
<tbody>
<tr>
<td>GD32VF103V Evaluation Kit</td>
<td>GD32VF103VBT6</td>
<td>108MHz</td>
<td>128KB</td>
<td>32KB</td>
</tr>
<tr>
<td>Sipeed Longan Nano</td>
<td>GD32VF103CBT6</td>
<td>108MHz</td>
<td>128KB</td>
<td>32KB</td>
</tr>
</tbody>
</table>

Stable and upstream versions

You can switch between stable releases of Nuclei development platform and the latest upstream version using platform option in “platformio.ini” (Project Configuration File) as described below.
Stable

```plaintext
; Latest stable version
[env:latest_stable]
platform = nuclei
board = ...

; Custom stable version
[env:custom_stable]
platform = nuclei@x.y.z
board = ...
```

Upstream

```plaintext
[env:upstream_develop]
platform = https://github.com/Nuclei-Software/platform-nuclei.git
board = ...
```

Packages

<table>
<thead>
<tr>

NXP LPC

**Configuration** `platform = nxplpc`

The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.

For more detailed information please visit vendor site.

Contents

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks

1.10. Development Platforms
Examples

Examples are listed from NXP LPC development platform repository:

- zephyr-blink
- mbed-rtos-blockdevice
- mbed-rtos-blink-baremetal
- mbed-rtos-thread-statistics
- zephyr-custom-board
- mbed-legacy-examples
- zephyr-synchronization

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.
# External Debug Tools

Boards listed below are compatible with Debugging but **DEPEND ON** external debug probe. They **ARE NOT READY** for debugging. Please click on board name for the further details.

# Stable and upstream versions

You can switch between **stable releases** of NXP LPC development platform and the latest upstream version using `platform` option in “platformio.ini” (Project Configuration File) as described below.

## Stable

```ini
; Latest stable version
[env:latest_stable]
platform = nxplpc
board = ...
```

(continues on next page)
### Custom stable version

```
[env:custom_stable]
platform = nxplpc@x.y.z
board = ...
```

### Upstream

```
[env:upstream_develop]
platform = https://github.com/platformio/platform-nxplpc.git
board = ...
```

RISC-V GAP

**Configuration**  
`platform = riscv_gap`

GreenWaves GAP8 IoT application processor enables the cost-effective development, deployment and autonomous operation of intelligent sensing devices that capture, analyze, classify and act on the fusion of rich data sources such as images, sounds or vibrations.

For more detailed information please visit vendor site.

**Contents**

- Configuration
- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

**Configuration**

- Drivers
- AutoTiler
- Running modes
  - Run from RAM
  - Run from RAM (without any bridge interaction)
  - Flash and run from RAM
  - Flash and run from Flash
  - Run from Flash
  - Run from Flash (without any bridge interaction)
- Uploading files to HyperFlash

**Drivers**

See “Drivers” section for *FTDI Chip* debug probe.

**AutoTiler**

You need GAP8 AutoTiler library, please request it via support@greenwaves-technologies.com
Put a library somewhere on a disk and add this folder to library path using `build_flags` in `platformio.ini` (Project Configuration File). For example,

```
[env:gapuino]
platform = riscv_gap
board = gapuino
framework = ...
build_flags = -L/path/to/libtile/folder
```

## Running modes

GAPuino supports 2 main modes:

1. Running from RAM, `boot_mode=jtag`
2. Running from HyperFlash, `boot_mode=jtag_hyper`

A running process can be controlled through the internal upload commands:

- `load`, @TODO
- `reqloop`, @TODO
- `ioloop`, @TODO
- `start`, @TODO
- `wait`, @TODO

You can configure “boot mode” and list of upload commands using “platformio.ini” (Project Configuration File). Default values are:

- `board_upload.boot_mode = jtag`
- `board_upload.commands = load reqloop ioloop start wait`

## Run from RAM

This is a default behavior when you run “Upload” task in PlatformIO IDE or use PlatformIO Core (CLI) and `pio run --target` command with `upload` target.

## Run from RAM (without any bridge interaction)

- Configure build environment using “platformio.ini” (Project Configuration File) as described below

```
[env:gapuino]
platform = riscv_gap
board = gapuino
framework = ...
board_upload.commands = load start
```

- Run “Upload” task in PlatformIO IDE or use PlatformIO Core (CLI) and `pio run --target` command with `upload` target.

## Flash and run from RAM

The same as Uploading files to HyperFlash.
Flash and run from Flash

- Configure build environment using "platformio.ini" (Project Configuration File) as described below

```ini
[env:gapuino]
platform = riscv_gap
board = gapuino
framework = ...
board_upload.boot_mode = jtag_hyper
board_upload.commands = reqloop ioloop start wait
```

- Perform *Uploading files to HyperFlash*.

Run from Flash

**Note:** You have to perform *Uploading files to HyperFlash* before.

- Configure build environment using "platformio.ini" (Project Configuration File) as described below

```ini
[env:gapuino]
platform = riscv_gap
board = gapuino
framework = ...
board_upload.boot_mode = jtag_hyper
board_upload.commands = start
```

- Run “Upload” task in *PlatformIO IDE* or use *PlatformIO Core (CLI)* and `pio run --target` command with upload target.

Run from Flash (without any bridge interaction)

**Note:** You have to perform *Uploading files to HyperFlash* before.

- Configure build environment using "platformio.ini" (Project Configuration File) as described below

```ini
[env:gapuino]
platform = riscv_gap
board = gapuino
framework = ...
board_upload.boot_mode = jtag_hyper
board_upload.commands = reqloop ioloop start wait
```

- Run “Upload” task in *PlatformIO IDE* or use *PlatformIO Core (CLI)* and `pio run --target` command with upload target.

Uploading files to HyperFlash

1. Create new project using *PlatformIO IDE* or initialize project using *PlatformIO Core (CLI)* and `pio project init` (if you have not initialized it yet)
2. Create a data folder (it should be on the same level as src folder) and put files here. Also, you can specify own location for data_dir.

3. Run “Upload File System image” task in PlatformIO IDE or use PlatformIO Core (CLI) and pio run --target command with uploadfs target.

Examples:

- PULP OS File System

## Examples

Examples are listed from RISC-V GAP development platform repository:

- gapuino-mbed-os-irq
- gapuino-mbed-autotiler-cifar10
- gapuino-mbed-driver-hyper-flash
- gapuino-pulp-os-i2c-eeprom

Stable and upstream versions

You can switch between stable releases of Shakti development platform and the latest upstream version using `platform` option in "platformio.ini" (Project Configuration File) as described below.

Stable

```ini
; Latest stable version
[env:latest_stable]
platform = shakti
board = ...

; Custom stable version
[env:custom_stable]
platform = shakti@x.y.z
board = ...
```

Upstream

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-shakti.git
board = ...
```

Packages

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>framework-shakti-sdk</td>
<td>A software development kit for developing applications on Shakti class of processors</td>
</tr>
<tr>

Silicon Labs EFM32

Configuration `platform = siliconlabsefm32`

Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to 48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features innovative low energy techniques, short wake-up time from energy saving modes and a wide selection of peripherals, making it ideal for battery operated applications and other systems requiring high performance and low-energy consumption.

For more detailed information please visit vendor site.

Examples

Examples are listed from Silicon Labs EFM32 development platform repository:

- zephyr-subsys-console-getline
- zephyr-blink
- mbed-rtos-blink-baremetal
- mbed-rtos-usb-cdc
- mbed-rtos-semaphore

ST STM32

Configuration \( \text{platform} = \text{ststm32} \)

The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.

- STM32Cube HAL and Nucleo-F401RE: debugging and unit testing

Configuration

Switching between Arduino cores

There are three different Arduino cores for STM32 microcontrollers: STM32Duino, Arduino STM32 (maple) and STM32L0. All of them have been developed independently, therefore, have different functionality and set of internal libraries. By default, official STM32Duino core is used (except cases when a board supports only one specific core). Some of the boards support all three cores. To change the core you can use `board_build.core` option that needs to be added to `build_flags`:

An example of “platformio.ini” (Project Configuration File) with maple core

```
[env:hy_tinystm103tb]
platform = ststm32
framework = arduino
board = hy_tinystm103tb
board_build.core = maple
```

STM32Duino configuration system

STM32Duino core has several options that can be configured using the next configuration flags in `build_flags` section of “platformio.ini” (Project Configuration File):
### PlatformIO Documentation, Release 5.0.5a1

**Table 12: C/C++ standard library configuration**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_STANDARD_LIB</td>
<td>Disable Newlib Nano library</td>

</tr>
<tr>
<td>ENABLE_USB_MASS_STORAGE</td>
<td>USB Mass Storage (MSC)</td>
</tr>
</tbody>
</table>

Example:
Arduino STM32L0 configuration system

Arduino STM32L0 core has several options that can be configured using the next configuration flags in `build_flags` section of "platformio.ini" (Project Configuration File):

Table 17: USB Configuration

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_ENABLE_MASS_STORAGE</td>
<td>Serial + Mass Storage</td>
</tr>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_ENABLE_HID</td>
<td>Serial + Keyboard + Mouse</td>
</tr>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_ENABLE_MASS_STORAGE_HID</td>
<td>Serial + Mass Storage + Keyboard + Mouse</td>
</tr>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_NO_USB</td>
<td>No USB</td>
</tr>
</tbody>
</table>

Table 18: FS Configuration

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_FS_SDCARD</td>
<td>SDCARD (SPI)</td>
</tr>
<tr>
<td>PIO_FRAMEWORK_ARDUINO_FS_SFLASH</td>
<td>SFLASH (SPI)</td>
</tr>
</tbody>
</table>

Example:

```
[env:cricket_l082cz]
platform = ststm32
framework = arduino
board = cricket_l082cz
build_flags = 
-D PIO_FRAMEWORK_ARDUINO_ENABLE_MASS_STORAGE
```

Examples

Examples are listed from ST STM32 development platform repository:

- mbed-rtos-wifi
- zephyr-blink
- stm32cube-ll-blink
- libopencm3-blink
- stm32cube-hal-usb-host-hid
- libopencm3-usb-cdcacm
- cmsis-blink
- stm32cube-hal-iap
- arduino-blink
- `stm32cube-hal-extmem-boot`
- `spl-blink`
- `stm32cube-hal-lcd`
- `mbed-rtos-mesh-minimal`

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - **On-Board Debug Tools**
  - **External Debug Tools**
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

### On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

Stable and upstream versions

You can switch between stable releases of ST STM32 development platform and the latest upstream version using platform option in “platformio.ini” (Project Configuration File) as described below.

Stable

```ini
; Latest stable version
[env:latest_stable]
platform = ststm32
board = ...

; Custom stable version
[env:custom_stable]
platform = ststm32@x.y.z
board = ...
```

Upstream

```ini
[env:upstream_develop]
platform = https://github.com/platformio/platform-ststm32.git
board = ...
```

**Warning:** Linux Users:
- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article [Enable serial port on Raspberry Pi](#)

**Windows Users:**
Please check that you have a correctly installed USB driver from board manufacturer
## Frameworks

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Arduino</td>
<td>Arduino Wiring-based Framework allows writing cross-platform software to control devices attached to a wide range of Arduino boards to create all kinds of creative coding, interactive objects, spaces or physical experiences.</td>
</tr>
<tr>
<td>CM-SIS</td>
<td>The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software re-use, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices.</td>
</tr>
<tr>
<td>Mbed</td>
<td>Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices.</td>
</tr>
<tr>
<td>STM32C</td>
<td>STM32Cube embedded software libraries, including: The HAL hardware abstraction layer, enabling portability between different STM32 devices via standardized API calls; The Low-Layer (LL) APIs, a light-weight, optimized, expert oriented set of APIs designed for both performance and runtime efficiency.</td>
</tr>
<tr>
<td>Standard Peripheral Library</td>
<td>The ST Standard Peripheral Library provides a set of functions for handling the peripherals on the STM32 family of microcontrollers.</td>
</tr>
<tr>
<td>Zephyr RTOS</td>
<td>The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind.</td>
</tr>
<tr>
<td>libopencm3</td>
<td>The libOpenCM3 framework aims to create a free and open-source firmware library for various ARM Cortex-M0(+)M3/M4 microcontrollers, including ST STM32, Ti Tiva and Stellaris, NXP LPC, Atmel SAM3, Energy Micro EFM32 and others.</td>
</tr>
</tbody>
</table>

### Boards

**Note:**

- You can list pre-configured boards by *pio boards* command or PlatformIO Boards Explorer.
- For more detailed board information please scroll the tables below by horizontally.

### ST STM8

**Configuration** `platform = ststm8`

The STM8 is an 8-bit microcontroller family by STMicroelectronics an extended variant of the ST7 microcontroller architecture. STM8 microcontrollers are particularly low cost for a full-featured 8-bit microcontroller.

For more detailed information please visit vendor site.

### Contents

- **Examples**
- **Debugging**
- **Stable and upstream versions**
- **Packages**
- **Frameworks**
- **Boards**

### Examples

Examples are listed from ST STM8 development platform repository:

- spl-blink
- arduino-fade-all-pins
• spl-uart
• spl-flash
• arduino-internal-lib
• arduino-ping-hc04

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

- Tools & Debug Probes
  - On-Board Debug Tools

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

<table>

<td>2KB</td>
</tr>
</tbody>
</table>

Stable and upstream versions

You can switch between stable releases of ST STM8 development platform and the latest upstream version using platform option in “platformio.ini” (Project Configuration File) as described below.

Stable

```ini
; Latest stable version
[env:latest_stable]
platform = ststm8
board = ...

; Custom stable version
[env:custom_stable]
```

(continues on next page)
platform = ststm8@x.y.z
board = ...

Upstream

[env:upstream_develop]
platform = https://github.com/platformio/platform-ststm8.git
board = ...

Packages

### Teensy

**Configuration** `platform = teensy`

Teensy is a complete USB-based microcontroller development system, in a very small footprint, capable of implementing many types of projects. All programming is done via the USB port. No special programmer is needed, only a standard USB cable and a PC or Macintosh with a USB port.

For more detailed information please visit [vendor site](#).

### Contents

- Configuration
- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards

### Configuration

- Optimization
- USB Features
Optimization

(valid only for Teensy LC, Teensy 3.0-3.6)

You can control firmware optimization via special macro/define using `build_flags` in “platformio.ini” (Project Configuration File):

- `-D TEENSY_OPT_FASTER`, default
- `-D TEENSY_OPT_FASTER_LTO`
- `-D TEENSY_OPT_FAST`
- `-D TEENSY_OPT_FAST_LTO`
- `-D TEENSY_OPT_FASTEST`
- `-D TEENSY_OPT_FASTEST_LTO`
- `-D TEENSY_OPT_FASTEST_PURE_CODE`, valid only for Teensy 3.5-3.6
- `-D TEENSY_OPT_FASTEST_PURE_CODE_LTO`, valid only for Teensy 3.5-3.6
- `-D TEENSY_OPT_DEBUG`
- `-D TEENSY_OPT_DEBUG_LTO`
- `-D TEENSY_OPT_SMALLEST_CODE`
- `-D TEENSY_OPT_SMALLEST_CODE_LTO`

The only one macro can be used in per one build environment. Also, you can see verbose build using `-v`, `--verbose` option for `pio run` command.

Example:

Let’s set optimization for the smallest code

```
[env:teensy_hid_device]
platform = teensy
framework = arduino
board = teensy36
build_flags = -D TEENSY_OPT_SMALLEST_CODE
```

USB Features

If you want to use Teensy USB Features, you need to add special macro/define using `build_flags`:

- `-D USB_SERIAL`
- `-D USB_KEYBOARDOONLY`
- `-D USB_TOUCHSCREEN`
- `-D USB_HID_TOUCHSCREEN`
- `-D USB_HID`
- `-D USB_SERIAL_HID`
- `-D USB_MIDI`
- `-D USB_MIDI4`
- `-D USB_MIDI16`
• `-D USB_MIDI_SERIAL`
• `-D USB_MIDI4_SERIAL`
• `-D USB_MIDI16_SERIAL`
• `-D USB_AUDIO`
• `-D USB_MIDI_AUDIO_SERIAL`
• `-D USB_MIDI16_AUDIO_SERIAL`
• `-D USB_MTDISK`
• `-D USB_RAWHID`
• `-D USB_FLIGHTSIM`
• `-D USB_FLIGHTSIM_JOYSTICK`
• `-D USB_EVERYTHING`
• `-D USB_DISABLED`

A default macro is set to `-D USB_SERIAL` if no one is specified.

Example:

```
[env:teensy_hid_device]
platform = teensy
framework = arduino
board = teensy20
build_flags = -D USB_RAWHID
```

See Teensy USB Examples.

**Examples**

Examples are listed from Teensy development platform repository:

• mbed-blink
• mbed-serial
• mbed-events
• arduino-blink
• arduino-hid-usb-mouse
• arduino-internal-libs
• mbed-dsp

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - **External Debug Tools**
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

### External Debug Tools

Boards listed below are compatible with Debugging but DEPEND ON external debug probe. They ARE NOT READY for debugging. Please click on board name for the further details.

</table>

Warning: Linux Users:

- Install “udev” rules `99-platformio-udev.rules`
- Raspberry Pi users, please read this article Enable serial port on Raspberry Pi.

Windows Users:

Teensy programming uses only Windows built-in HID drivers. When Teensy is programmed to act as a USB Serial device, Windows XP, Vista, 7 and 8 require this serial driver is needed to access the COM port your program uses. No special driver installation is necessary on Windows 10.

**TI MSP430**

**Configuration** platform = timsp430

MSP430 microcontrollers (MCUs) from Texas Instruments (TI) are 16-bit, RISC-based, mixed-signal processors designed for ultra-low power. These MCUs offer the lowest power consumption and the perfect mix of integrated peripherals for thousands of applications.

For more detailed information please visit vendor site.

**Examples**

Examples are listed from TI MSP430 development platform repository:

- arduino-blink
- native-blink
- arduino-internal-libs

**Debugging**

*Debugging* - “1-click” solution for debugging with a zero configuration.
Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

### On-Board Debug Tools

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

### TI TIVA

**Configuration** \( \text{platform} = \text{titiva} \)

Texas Instruments TM4C12x MCUs offer the industry's most popular ARM Cortex-M4 core with scalable memory and package options, unparalleled connectivity peripherals, advanced application functions, industry-leading analog integration, and extensive software solutions.

For more detailed information please visit [vendor site](#).

## Contents

- Examples
- Debugging
- Stable and upstream versions
- Packages
- Frameworks
- Boards
Examples

Examples are listed from TI TIVA development platform repository:

- libopencm3-blink
- libopencm3-usb-cdcacm
- arduino-blink
- native-blink
- arduino-internal-libs

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - **On-Board Debug Tools**

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning**: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

<table>
<thead>

1.10.2 Desktop

Native

**Configuration platform** = native

Native development platform is intended to be used for desktop OS. This platform uses built-in toolchains (preferable based on GCC), frameworks, libs from particular OS where it will be run.

For more detailed information please visit vendor site.

### Contents

- Examples
- Stable and upstream versions

Examples

Examples are listed from Native development platform repository:

- hello-world

Stable and upstream versions

You can switch between stable releases of Native development platform and the latest upstream version using `platform` option in "platformio.ini" (Project Configuration File) as described below.

**Stable**

```ini
; Latest stable version
[env:latest_stable]
platform = native
board = ...

; Custom stable version
[env:custom_stable]
platform = native@x.y.z
board = ...
```

1.10. Development Platforms
Linux ARM

Configuration \textit{platform} = \texttt{linux\_arm}

Linux ARM is a Unix-like and mostly POSIX-compliant computer operating system (OS) assembled under the model of free and open-source software development and distribution. Using host OS (Mac OS X, Linux ARM) you can build native application for Linux ARM platform.

For more detailed information please visit vendor site.

Contents

## Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ASR Microelectronics ASR605x</strong></td>
<td>ASR Microelectronics ASR605x series is highly integrated and ultra low power SoC based on the PSoC 4000 series MCU (ARM Cortex M0+ Core) and Semtech SX1262 transceiver.</td>
</tr>
<tr>
<td><strong>Atmel AVR</strong></td>
<td>Atmel AVR 8-bit MCUs deliver a unique combination of performance, power efficiency and design flexibility. Optimized to speed time to market-and easily adapt to new ones-they are based on the industry’s most code-efficient architecture for C and assembly programming</td>
</tr>
<tr>
<td><strong>Atmel megaAVR</strong></td>
<td>8-bit MCUs Built for Real-time Control with Core Independent Peripherals combining intelligent hardware peripherals along with the low-power capability of an AVR core, megaAVR microcontrollers (MCUs) broaden the effectiveness of your real-time control systems.</td>
</tr>
<tr>
<td><strong>Atmel SAM</strong></td>
<td>Atmel i SMART offers Flash- based ARM products based on the ARM Cortex-M0+, Cortex-M3 and Cortex-M4 architectures, ranging from 8KB to 2MB of Flash including a rich peripheral and feature mix.</td>
</tr>
<tr>
<td><strong>Espressif 32</strong></td>
<td>Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.</td>
</tr>
<tr>
<td><strong>Espressif 8266</strong></td>
<td>Espressif Systems is a privately held fabless semiconductor company. They provide wireless communications and Wi-Fi chips which are widely used in mobile devices and the Internet of Things applications.</td>
</tr>
<tr>
<td><strong>GigaDevice GD32V</strong></td>
<td>The GigaDevice GD32V device is a 32-bit general-purpose microcontroller based on the RISC-V core with an impressive balance of processing power, reduced power consumption and peripheral set.</td>
</tr>
<tr>
<td><strong>Infineon XMC</strong></td>
<td>Infineon has designed the XMC microcontrollers for real-time critical applications with an industry-standard core. The XMC microcontrollers can be integrated with the Arduino platform</td>
</tr>
<tr>
<td><strong>Intel ARC32</strong></td>
<td>ARC embedded processors are a family of 32-bit CPUs that are widely used in SoC devices for storage, home, mobile, automotive, and Internet of Things applications.</td>
</tr>
<tr>
<td><strong>Kendryte K210</strong></td>
<td>Kendryte K210 is an AI capable RISCV64 dual core SoC.</td>
</tr>
<tr>
<td><strong>Microchip PIC32</strong></td>
<td>Microchip’s 32-bit portfolio with the MIPS microAptiv or M4K core offer high performance microcontrollers, and all the tools needed to develop your embedded projects. PIC32 MCUs gives your application the processing power, memory and peripherals your design needs!</td>
</tr>
<tr>
<td><strong>Nordic nRF51</strong></td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.</td>
</tr>
<tr>
<td><strong>Nordic nRF52</strong></td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td><strong>ST STM32</strong></td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
<tr>
<td><strong>ST STM8</strong></td>
<td>The STM8 is an 8-bit microcontroller family by STMicroelectronics an extended variant of the ST7 microcontroller architecture. STM8 microcontrollers are particularly low cost for a full-featured 8-bit microcontroller.</td>
</tr>
<tr>
<td><strong>Teensy</strong></td>
<td>Teensy is a complete USB-based microcontroller development system, in a very small footprint, capable of implementing many types of projects. All programming is done via the USB port. No special programmer is needed, only a standard USB cable and a PC or Macintosh with a USB port.</td>
</tr>
<tr>
<td><strong>TI MSP430</strong></td>
<td>MSP430 microcontrollers (MCUs) from Texas Instruments (TI) are 16-bit, RISC-based, mixed-signal processors designed for ultra-low power. These MCUs offer the lowest power consumption and the perfect mix of integrated peripherals for thousands of applications.</td>
</tr>

1.11.2 CMSIS

**Configuration framework = cmsis**

The ARM Cortex Microcontroller Software Interface Standard (CMSIS) is a vendor-independent hardware abstraction layer for the Cortex-M processor series and specifies debugger interfaces. The CMSIS enables consistent and simple software interfaces to the processor for interface peripherals, real-time operating systems, and middleware. It simplifies software re-use, reducing the learning curve for new microcontroller developers and cutting the time-to-market for devices.

For more detailed information please visit vendor site.

## Contents

- Debugging
- Examples
- Platforms
- Boards

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - On-Board Debug Tools
  - External Debug Tools

### Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in "platformio.ini" *(Project Configuration File)*.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.
On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ST STM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
</tbody>
</table>
## Boards

**Note:**
- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

### 1.11.3 ESP8266 Non-OS SDK

**Configuration** `framework = esp8266-nonos-sdk`

The non-OS SDK provides a set of application programming interfaces (APIs) for core ESP8266 functionalities such as data reception/transmission over Wi-Fi, TCP/IP stack functions, hardware interface functions and basic system management functions.

For more detailed information please visit vendor site.

### 1.11.5 Espressif IoT Development Framework

**Configuration framework = espidf**

ESP-IDF is the official development framework for the ESP32 and ESP32-S Series SoCs.

For more detailed information please visit vendor site.

### Contents

- **Tutorials**
- **Configuration**
- **Debugging**
- **Examples**
- **Platforms**
- **Boards**

### Tutorials

- Get started with ESP-IDF and ESP32-DevKitC: debugging, unit testing, project analysis
Configuration

Note: Starting with ESP-IDF v4.0, a CMake-based build system is used. Different configuration steps are required for ESP-IDF v3.x due to a legacy build system based on GNU Make.

- Configuration for 4.0
- Configuration for 3.0, 3.1, 3.2, 3.3

Each release of Espressif 32 platform uses a specific version of ESP-IDF. The latest version of the platform only supports the latest stable version of the framework.

Warning: ESP-IDF v4.0 projects are not backwards-compatible with ESP-IDF v3.x projects in terms of project configuration process.

Configuration for 4.0

- Project Structure
- ESP-IDF components
- ULP coprocessor programming
- Limitations

The general project configuration (default optimization level, bootloader configuration partition tables, etc) is set in a single file called sdkconfig in the root folder of the project. This configuration file can be modified via a special target called menuconfig (PlatformIO v4.3.0 greater is required):

```
pio run -t menuconfig
```

Warning: ESP-IDF requires some extra tools to be installed in your system in order to build firmware for supported chips. Most of these tools are available in PlatformIO ecosystem as standalone packages, but in order to use configuration tool called menuconfig several additional packages need to be installed on Linux-based systems:

```
libncurses5-dev flex bison
```

More details about required packages can be found in the official ESP-IDF documentation - Standard Setup of Toolchain for Linux.

Project Structure

The ESP-IDF framework requires an unusual project structure because most of the framework configuration is performed by the native for the ESP-IDF build system called CMake.

A typical PlatformIO project for the ESP-IDF framework must have the following structure:
Tip: It’s also possible to use the default ESP-IDF project structure with `main` folder. To specify `main` as the folder with source files use `src_dir` option, for example:

```plaintext
[platformio]
src_dir = main

[env:esp32dev]
platform = espressif32
framework = espidf
board = esp32dev
```

Besides the files related to PlatformIO project, there are several additional ESP-IDF-specific files: the main `CMakeLists.txt`, project-specific `CMakeLists.txt` in `src_dir` and optional default configuration file `sdkconfig.defaults`. `CMakeLists.txt` files enable features supported by the ESP-IDF’s build system, e.g. ULP configuration, adding extra components, etc. A typical `CMakeLists.txt` file in the root folder has the following content:

```plaintext
# The following lines of boilerplate have to be in your project's CMakeLists
# in this exact order for cmake to work correctly
cmake_minimum_required(VERSION 3.16.0)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(project-name)
```

The second `CMakeLists.txt` in `src_dir` is responsible for controlling the build process of the component and its integration into the overall project. The minimal component `CMakeLists.txt` file simply registers the component to the build system using `idf_component_register`:

```plaintext
idf_component_register(SRCS "foo.c" "bar.c")
```

The files specified using `idf_component_register` are used ONLY for generating build configurations, but it’s highly recommended to specify all application source files in order to keep the project compatible with the usual ESP-IDF workflow.

**Warning:** By default PlatformIO expects source files to be located in the `src` folder. At the same time, the default location for source files within the ESP-IDF build system is a special folder with the name `main`. Renaming the main component may require users to manually specify additional dependencies:

```plaintext
idf_component_register(SRCS "main.c" REQUIRES idf::mbedtls)
```

More details in the official ESP-IDF documentation - Renaming main component.

Due to the current limitations of CMake file-based API, there is no way of generating build configuration for source files written in various programming languages if they are not specified in `idf_component_register` command. If your project contains libraries written in languages that differ from the language used for the main application you
need to create an empty file with the desired extension (e.g. *.cpp for C++) in order to force CMake generate build configuration for this language.

**Note:** Build configuration generated for source files specified in `idf_component_register` is also used as the base build environment for project sources (including libraries).

### ESP-IDF components

ESP-IDF modules as modular pieces of standalone code might be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF.

These components contain either a single `CMakeLists.txt` file which controls the build process of the component and its integration into the overall project. An optional `Kconfig` file defines the component configuration options that can be set via `menuconfig`. Some components may also include `Kconfig.projbuild` and `project_include.cmake` files, which are special files for overriding parts of the project. All valid components will be compiled as static libraries and linked to the final firmware. There are two possible ways of adding extra components to PlatformIO project:

- By adding a new component to an optional folder called `components` in the root of your project. This folder will be automatically scanned for valid components.
- Using `EXTRA_COMPONENT_DIRS` option in the root `CMakeLists.txt` file. This option represents a list of extra directories to search for components.

An example of specifying `esp-aws-iot` as an extra component:

```cmake
# The following lines of boilerplate have to be in your project's CMakeLists
# in this exact order for cmake to work correctly
cmake_minimum_required(VERSION 3.16)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
list(APPEND EXTRA_COMPONENT_DIRS esp-aws-iot)
project(subscribe_publish)
```

**Warning:** Since `src_dir` is also passed to CMake as an extra component, you should only append to `EXTRA_COMPONENT_DIRS` variable in order not to override the default package.

Since the build may not work correctly if the full path to sources is greater than 250 characters (see `CMAKE_OBJECT_PATH_MAX`) it might be a good idea to keep modules close to the project files.

### ULP coprocessor programming

If you want to take measurements using ADC, internal temperature sensor or external I2C sensors, while the main processors are in deep sleep mode you need to use ULP coprocessor. At the moment ULP can be used only with the *Espressif IoT Development Framework*.

All ULP code, usually written in assembly in files with `.S` extension, must be placed into a separate directory with the name `ulp` in the root folder of your project. So your project structure should look like this:

```
project_dir
    ├── include
```

(continues on next page)
Since PlatformIO uses the code model generated by CMake it’s mandatory to specify ULP source files in CMakeLists.txt as well. An example of typical CMakeLists.txt for ULP:

```cmake
idf_component_register(
    SRCS "ulp_adc_example_main.c"
)
#
# ULP support additions to component CMakeLists.txt.
#
# 1. The ULP app name must be "ulp_main"
set(ulp_app_name ulp_main)
#
# 2. Specify all assembly source files.
# Paths are relative because ULP files are placed into a special directory "ulp"
# in the root of the project
set(ulp_s_sources "../ulp/adc.S")
#
# 3. List all the component source files which include automatically
# generated ULP export file, ${ulp_app_name}.h:
set(ulp_exp_dep_srcs "ulp_adc_example_main.c")
#
# 4. Call function to build ULP binary and embed in project using the argument
# values above.
ulp_embed_binary(${ulp_app_name} ${ulp_s_sources} ${ulp_exp_dep_srcs})
```

See full examples with ULP coprocessor programming:

- https://github.com/platformio/platform-espressif32/tree/develop/examples/espidf-ulp-adc
- https://github.com/platformio/platform-espressif32/tree/develop/examples/espidf-ulp-pulse

More details are located in the official ESP-IDF documentation - ULP coprocessor programming.

### Limitations

At the moment several limitations are present:

- No whitespace characters allowed in project paths. This limitation is imposed by the native ESP-IDF build system. This affects users that have a whitespace in their username or added a whitespace to the project name. As a workaround, it’s recommended to move core_dir to a folder without spaces. For example:

  ```ini
  [platformio]
  core_dir = C:/platformio
  
  [env:esp32dev]
  platform = espressif32
  framework = espidf
  board = esp32dev
  ```

- The src_filter option cannot be used. It’s done to preserve compatibility with existing ESP-IDF projects. List of source files is specified in the project CMakeLists.txt file.
Configuration for 3.0, 3.1, 3.2, 3.3

Support for ESP-IDF v3.x is considered obsolete and is not available in the latest platform releases. Please check the platform release notes to figure out what version of the platform should be installed to use required ESP-IDF version, for example:

```
[env:esp32dev]
; v1.10.0 is the last version that supports ESP-IDF v3.3
platform = espressif32@1.10.0
framework = espidf
board = esp32dev
```

**Project Structure**

Due to limited support of GNU Make build system used in ESP-IDF v3.x, the project configuration depends on a pregenerated file `sdkconfig.h` which contains a list of macro definitions `CONFIG_*`. These definitions describe project settings that will be used for preparing a proper build environment. You can use the default `sdkconfig.h` shipped with the platform or generate a custom one using native ESP-IDF build environment.

A typical PlatformIO project for ESP-IDF v3.x must have the following structure:

```
project_dir
  └── include
  │    └── README
  ├── lib
  │    └── test
  └── src
      └── sdkconfig.h
          └── main.c
      └── platformio.ini
```

**Enable C++ exceptions**

To enable C++ exceptions for *Espressif IoT Development Framework* add `-D PIO_FRAMEWORK_ESP_IDF_ENABLE_EXCEPTIONS` to `build_flags` of “platformio.ini” (Project Configuration File).

See project example with enabled exceptions.

**ULP coprocessor programming**

To use ULP in your project you need to make sure that it’s enabled in the `sdkconfig.h` configuration file. The following two lines must be added:

```
#define CONFIG_ULP_COPROC_ENABLED 1
#define CONFIG_ULP_COPROC_reserve_MEM 1024
```

Usually `CONFIG_ULP_COPROC_reserve_MEM` is already defined in the default `sdkconfig.h` with value 0. You can modify this value to meet your requirements.

All ULP code, usually written in assembly in files with `.S` extension, must be placed into a separate directory with the name `ulp` in the root folder of your project. So your project structure should look like this:
See full examples with ULP coprocessor programming for ESP-IDF v3.x:

- https://github.com/platformio/platform-espressif32/tree/v1.10.0/examples/espidf-ulp-adc
- https://github.com/platformio/platform-espressif32/tree/v1.10.0/examples/espidf-ulp-pulse

### Debugging

**Debugging** - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - On-Board Debug Tools
  - External Debug Tools

#### Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

#### On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

<table>
<thead>
<tr>
<th>Name</th>
<th>Platform</th>

1.11.6 Freedom E SDK

**Configuration**  \textit{framework} = \textit{freedom-e-sdk}

Open Source Software for Developing on the SiFive Freedom E Platform

For more detailed information please visit vendor site.

Contents

- Configuration
- Debugging
- Examples
- Platforms
- Boards

Configuration

Using with FreeRTOS

In order to add FreeRTOS to your project, it must be explicitly specified as an additional framework in the \textit{framework} field of \textit{“platformio.ini” (Project Configuration File)}, for example:

```
[env:freertos]
platform = sifive
framework = freedom-e-sdk, freertos
board = ...
```

**Note:** FreeRTOS RISC-V port for the \textit{SiFive} development platform is distributed as part of \textit{Freedom E SDK} and cannot be used as a standalone framework

Most of the application specific configuration is done in a special file called \textit{FreeRTOSConfig.h} which must be present in each FreeRTOS-based project. Additional settings for build configuration are set in \textit{“platformio.ini” (Project Configuration File)} using the following syntax \texttt{board_build.freertos.*} where \(*\) is an option from the following list:

**FreeRTOS settings**

\begin{itemize}
  \item \texttt{heap_model}
\end{itemize}

Available values: heap_1, heap_2, heap_3, heap_4, heap_5 \texttt{Default: heap_4}

FreeRTOS offers several heap management schemes that range in complexity and features:

- heap_1 – the very simplest, does not permit memory to be freed.
- heap_2 – permits memory to be freed, but does not coalescence adjacent free blocks.
- heap_3 – simply wraps the standard \texttt{malloc()} and \texttt{free()} for thread safety.
- heap_4 – coalescences adjacent free blocks to avoid fragmentation. Includes absolute address placement option.
• heap_5 – as per heap_4, with the ability to span the heap across multiple non-adjacent memory areas.

More information about FreeRTOS Memory Management can be found in the official documentation.

interrupt_handler
Default: FreedomMetal INTERRUPT_HANDLER
The name of a function to be called to handle interrupts

exception_handler
Default: FreedomMetal_EXCEPTION_HANDLER
The name of a function to be called to handle exceptions

mtime_ctrl_addr
Default: 0x2000000
The address of Machine Timer Register mtime

mpu_wrappers
Available values: enable | disable | Default: disable
Use Memory Protection Unit wrappers

Segger SystemView settings

SystemView is a real-time recording and visualization tool for embedded systems that reveals the true runtime behavior of an application.

systemview
Available values: enable | disable | Default: disable
Compile and link Segger SystemView library

sysview_record_enter_isr
Default: SEGGER_SYSVIEW_RecordEnterISR
The name of a function to be called to record interrupt execution.

sysview_record_exit_isr
Default: SEGGER_SYSVIEW_RecordExitISR
The name of a function to be called to record finish of interrupt execution.

sysview_record_exit_isr_to_scheduler
Default: SEGGER_SYSVIEW_RecordExitISRToScheduler
The name of a function to be called to record finish of interrupt when it’s caused by a context switch.

An example of “platformio.ini” (Project Configuration File) with modified heap settings and enabled SystemView feature:

```ini
[env:sifive-hifive1-revb]
platform = sifive
framework = freedom-e-sdk, freertos
board = hifive1-revb
monitor_speed = 115200
; Configure stack size
```
board_build.freedom-e-sdk.heap_size = 0x400
; Configure heap model and enable SystemView
board_build.freertos.heap_model = heap_1
board_build.freertos.systemview = enable

More information about FreeRTOS package for SiFive development platform can be found in the official repository.

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

- Tools & Debug Probes
  - On-Board Debug Tools

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

**External Debug Tools**

Boards listed below are compatible with Debugging but DEPEND ON external debug probe. They ARE NOT READY for debugging. Please click on board name for the further details.

### Examples

- `libopencm3` for ST STM32
- `libopencm3` for TI TIVA

### Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ST STIM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
<tr>
<td>TI TIVA</td>
<td>Texas Instruments TM4C12x MCUs offer the industry's most popular ARM Cortex-M4 core with scalable memory and package options, unparalleled connectivity peripherals, advanced application functions, industry-leading analog integration, and extensive software solutions.</td>
</tr>
</tbody>
</table>

### Boards
Note:

- You can list pre-configured boards by *pio boards* command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

1.11.12 Mbed

Configuration framework = mbed

Arm Mbed OS is an open source embedded operating system designed specifically for the ‘things’ in the Internet of Things. It includes all the features you need to develop a connected product based on an Arm Cortex-M microcontroller, including security, connectivity, an RTOS and drivers for sensors and I/O devices.

For more detailed information please visit vendor site.
Configuration

- Configuration system
  - Mbed OS 6
  - Mbed OS 5 and Mbed 2
- Build profiles
- Ignoring particular components
- Custom Targets

Configuration system

**Warning:** In Mbed OS 6 the list of supported boards was heavily reduced, only officially supported and well maintained targets left. More information in the official explanation. In order to keep legacy projects built on top of Mbed OS 5 compilable, each development platform contains a list of deprecated boards that is used to dynamically select the proper version of Mbed OS (OS5 or OS6).

PlatformIO allows you to customize mbed OS compile time configuration parameters using `mbed_app.json` manifest. It should be placed into the root of your project and located on the same level as “`platformio.ini`” (Project Configuration File).

Configuration is defined using **JSON**. Some examples of configuration parameters:

- The sampling period for a data acquisition application.
- The default stack size for a newly created OS thread.
- The receive buffer size of a serial communication library.
- The flash and RAM memory size of a target board.

See more details in the official ARM Mbed OS Configuration System.

A few PlatformIO-ready projects based on ARM mbed OS which use `mbed_app.json`:

- Freescale Kinetis: mbed-rtos-kvstore
- ST STM32: mbed-rtos-mesh-minimal

**Warning:** On Windows the maximum length for a path (file name and directory route, also known as `MAX_PATH`) — has been defined by 260 characters which can lead to compilation error for some targets. It’s possible to shorten these paths is to install packages in root of any logical disk by specifying `core_dir`.

Mbed OS 6

Using Bare Metal profile

The bare metal profile implements a subset of Mbed OS’s RTOS APIs that are useful in non-threaded applications, such as semaphores (calling the release API from interrupts) and tickers (to set up a recurring interrupt). It does not
include an RTX, and is therefore suitable for applications that do not require complex thread management. Instead of the RTOS’s scheduler, all activities are polled or interrupt-driven.

Useful links:
- Detailed description of bare metal profile
- Porting a target from Mbed OS 2 to Mbed OS 6 bare metal

**Mbed OS 5 and Mbed 2**

PlatformIO allows compiling projects with or without Mbed OS 5. By default, project is built without the OS feature. Most of the framework functionality requires the OS to be enabled. To add the OS feature you can use a special macro definition that needs be added to `build_flags` of “platformio.ini” (Project Configuration File):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIOFRAMEWORKMBEDRTOSPRESENT</td>
<td>Build the project with enabled rtos</td>
</tr>
</tbody>
</table>

An example of “platformio.ini” (Project Configuration File) with enabled rtos

```
[env:wizwiki_w7500p]
platform = wiznet7500
framework = mbed
board = wizwiki_w7500p
build_flags = -D PIOFRAMEWORKMBEDRTOSPRESENT
```

**Build profiles**

By default, PlatformIO builds your project using `develop` profile which provides optimized firmware size with full error information and allows MCU to go to sleep mode. In the case when default build profile is not suitable for your project there two other profiles `release` and `debug` that can be enabled using special macro definitions. You can change build profile `build_flags` of “platformio.ini” (Project Configuration File):

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MBEDBUILDPROFILERELEASE</td>
<td>Release profile (smallest firmware, minimal error info)</td>
</tr>
<tr>
<td>MBEDBUILDPROFILEDEBUG</td>
<td>Debug profile (largest firmware, disabled sleep mode)</td>
</tr>
</tbody>
</table>

More information about differences between build profiles can be found on the official page ARM Mbed OS Build Profiles.

**Ignoring particular components**

In case you don’t need all parts of the framework or you want to reduce the compilation time, you can explicitly exclude folders with redundant sources. For example, to remove cellular, mbedtls and nanostack features from the build process, navigate to `packages_dir` and create a new file `framework-mbed/features/.mbedignore` with the following contents:

```
cellular/*
mbedtls/*
nanostack/*
```

If you want to exclude the entire folder, simply create `.mbedignore` file and add only one symbol * to this file.

1.11. Frameworks
Custom Targets

In case when your board is not officially supported by Mbed you can manually add custom board definitions to your project. First of all, you need to create a special file custom_targets.json in the root folder of your project where you describe your board, for example here is the configuration for NUCLEO-F401RE board:

```json
{
    "NUCLEO_F401RE": {
        "inherits": [
            "MCU_STM32"
        ],
        "supported_form_factors": [
            "ARDUINO",
            "MORPHO"
        ],
        "core": "Cortex-M4F",
        "extra_labels_add": [
            "STM32F4",
            "STM32F401xE"
        ],
        "macros_add": [
            "STM32F401xE"
        ],
        "config": {
            "clock_source": {
                "help": "Mask value : USE_PLL_HSE_EXTC | USE_PLL_HSE_XTAL (need HW patch) | USE_PLL_HSI",
                "value": "USE_PLL_HSE_EXTC|USE_PLL_HSI",

        ],
        "device_name": "STM32F401RE"
    }
}
```

Secondly, you need to add code specific to your target to the src folder of your project. Usually, it’s a good idea to isolate this code in a separate folder and add the path to this folder to build_flags of “platformio.ini” (Project Configuration File):

```
[env:my_custom_board]
platform = nxplpc
framework = mbed
board = my_custom_board
build_flags = -I$PROJECT_SRC_DIR/MY_CUSTOM_BOARD_TARGET
```

Next, you need to inform PlatformIO that there is a new custom board. To do this, you can create boards directory in the root folder of your project and add a board manifest file with your board name, e.g. my_custom_board.json as described here Custom Embedded Boards

After these steps, your project structure should look like this:
More information about adding custom targets can be found on the official page Adding and configuring targets.

See full examples with a custom board:

**Debugging**

*Debugging* – “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - On-Board Debug Tools
  - External Debug Tools

**Tools & Debug Probes**

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in “platformio.ini” (*Project Configuration File)*.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

**On-Board Debug Tools**

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

### External Debug Tools

Boards listed below are compatible with Debugging but **DEPEND ON** external debug probe. They **ARE NOT READY** for debugging. Please click on board name for the further details.

## Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atmel SAM</td>
<td>Atmel</td>
</tr>
<tr>
<td>Freescale Kinetis</td>
<td>Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.</td>
</tr>
<tr>
<td>Maxim 32</td>
<td>Maxim’s microcontrollers provide low-power, efficient, and secure solutions for challenging embedded applications. Maxim’s processors embed cutting-edge technologies to secure data and intellectual property, proven analog circuitry for real-world applications, and battery-conserving low power operation.</td>
</tr>
<tr>
<td>Nordic nRF51</td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.</td>
</tr>
<tr>
<td>Nordic nRF52</td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td>NXP i.MX RT</td>
<td>The i.MX RT series of crossover processors features the Arm Cortex-M core, real-time functionality and MCU usability at a cost-effective price.</td>
</tr>
<tr>
<td>NXP LPC</td>
<td>The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.</td>
</tr>
<tr>
<td>RISC-V GAP</td>
<td>GreenWaves GAP8 IoT application processor enables the cost-effective development, deployment and autonomous operation of intelligent sensing devices that capture, analyze, classify and act on the fusion of rich data sources such as images, sounds or vibrations.</td>
</tr>
<tr>
<td>Silicon Labs EFM32</td>
<td>Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to 48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features innovative low energy techniques, short wake-up time from energy saving modes and a wide selection of peripherals, making it ideal for battery operated applications and other systems requiring high performance and low-energy consumption.</td>
</tr>
<tr>
<td>ST STM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
<tr>
<td>Teensy</td>
<td>Teensy is a complete USB-based microcontroller development system, in a very small footprint, capable of implementing many types of projects. All programming is done via the USB port. No special programmer is needed, only a standard USB cable and a PC or Macintosh with a USB port.</td>
</tr>
<tr>
<td>WIZ-Net W7500</td>
<td>The IOP (Internet Offload Processor) W7500 is the one-chip solution which integrates an ARM Cortex-M0, 128KB Flash and hardwired TCP/IP core for various embedded application platform especially requiring Internet of things</td>
</tr>
</tbody>
</table>

## Boards

Note:
- You can list pre-configured boards by *pio boards* command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ST STM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
<tr>
<td>ST STM8</td>
<td>The STM8 is an 8-bit microcontroller family by STMicroelectronics an extended variant of the ST7 microcontroller architecture. STM8 microcontrollers are particularly low cost for a full-featured 8-bit microcontroller.</td>
</tr>
</tbody>
</table>

Boards

Note:
- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

### 1.11.20 STM32Cube

**Configuration** `framework = stm32cube`

STM32Cube embedded software libraries, including: The HAL hardware abstraction layer, enabling portability between different STM32 devices via standardized API calls; The Low-Layer (LL) APIs, a light-weight, optimized, expert oriented set of APIs designed for both performance and runtime efficiency

For more detailed information please visit [vendor site](#).

Boards

Tutorials

- STM32Cube HAL and Nucleo-F401RE: debugging and unit testing

Using with STM32CubeMX

At the moment there is no seamless integration with projects generated by STM32CubeMX tool. Instead, a small cross-platform Python application called stm32pio can be used to create and update PlatformIO projects from STM32CubeMX .ioc files. It uses STM32CubeMX to generate a HAL-framework-based code and alongside creates PlatformIO project with compatible parameters to stick them both together.

More details about stm32pio tool can be found in the official repository.

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

Tools & Debug Probes

- On-Board Debug Tools
- External Debug Tools

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

On-Board Debug Tools

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

External Debug Tools

Boards listed below are compatible with Debugging but DEPEND ON external debug probe. They ARE NOT READY for debugging. Please click on board name for the further details.

Examples

- STM32Cube for ST STM32
Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ST STM32</strong></td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
</tbody>

1.11.21 WD-Firmware

**Configuration** framework = wd-riscv-sdk

The WD Firmware package contains firmware applications and Processor Support Package (PSP) for various cores, alongside demos which support all features.

For more detailed information please visit vendor site.

Contents

- Debugging
  - Examples
  - Platforms
  - Boards

Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

- Tools & Debug Probes
  - On-Board Debug Tools

Tools & Debug Probes

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).
### On-Board Debug Tools

Boards listed below have on-board debug probe and **ARE READY** for debugging! You do not need to use/buy external debug probe.

### 1.11.22 WiringPi

**Configuration** `framework = wiringpi`

WiringPi is a GPIO access library written in C for the BCM2835 used in the Raspberry Pi. It’s designed to be familiar to people who have used the Arduino ‘wiring’ system.

For more detailed information please visit [vendor site](#).
Examples

- WiringPi for Linux ARM

Platforms

1.11.23 Zephyr RTOS

Configuration `framework = zephyr`

The Zephyr Project is a scalable real-time operating system (RTOS) supporting multiple hardware architectures, optimized for resource constrained devices, and built with safety and security in mind.

For more detailed information please visit vendor site.
Tutorials

- Zephyr and Nordic nRF52-DK: debugging, unit testing, project analysis
- Enabling PlatformIO and Zephyr on custom hardware

Configuration

- Project Structure
- Devicetree overlays
- Embedding files at compile time
- Zephyr modules
- Limitations

Project Structure

**Warning:** Zephyr framework currently requires Python 3.4 or later.

Zephyr framework requires an unusual project structure because most of the framework configuration is performed by the native for Zephyr build system called CMake.

**Note:** Since PlatformIO is able to generate CMake-based projects for certain IDEs, Zephyr-related files are moved to a separate folder in order to avoid conflicts between project files. That requires users to specify relative paths to source files in CMakeLists.txt.

A typical PlatformIO project for Zephyr framework must have the following structure:

```
project_dir
  |--- include
  |--- src
  |     |--- main.c
  |--- zephyr
  |     |--- prj.conf
  |     |--- CMakeLists.txt
  |--- platformio.ini
```
Besides files related to PlatformIO project, there is an additional folder \texttt{zephyr} that contains Zephyr-specific files \texttt{CMakeLists.txt} and \texttt{prj.conf}:

\texttt{CMakeLists.txt} file enables features supported by Zephyr’s build system, e.g. board-specific kernel configuration files. A typical \texttt{CMakeLists.txt} file has the following content:

\begin{verbatim}
# Boilerplate code, which pulls in the Zephyr build system.
cmake_minimum_required(VERSION 3.13.1)
include($ENV{ZEPHYR_BASE}/cmake/app/boilerplate.cmake NO_POLICY_SCOPE)
project(my_zephyr_app)
# Add your source file to the "app" target. This must come after the boilerplate
# code, which defines the target. Note relative path to source file
target_sources(app PRIVATE ../src/main.c)
\end{verbatim}

The files specified in \texttt{target_sources} are used \textbf{ONLY} for generating build configurations, but it’s highly recommended to specify all application source files in order to keep the project compatible with the usual Zephyr workflow.

Due to the current limitations of CMake file-based API, there is no way to generate build configuration for source files written in various programming languages if they are not specified in \texttt{target_sources} command. If your project contains libraries written in languages that differ from the language used for the main application you need to create an empty file with desired extension (e.g. \texttt{*.cpp} for C++) in order to force CMake generate build configuration for this language.

\textbf{Note:} Build configuration generated for source files specified in \texttt{target_sources} is also used as the base build environment for project sources (including libraries).

\texttt{prj.conf} file sets application-specific values for one or more kernel configuration options. These application settings are merged with board-specific settings to produce a kernel configuration.

\section*{Devicetree overlays}

Zephyr applications can use overlay files to enable a peripheral that is disabled by default, select a sensor on the board for an application specific purpose, etc. This makes it possible to reconfigure the kernel and device drivers without modifying source code. There are several ways to set \texttt{.overlay} files:

\begin{itemize}
  \item Using \texttt{DTC_OVERLAY_FILE} variable in the \texttt{CMakeLists.txt} file, before including Zephyr’s \texttt{boilerplate.cmake} file. (Recommended)
  \item Using a \texttt{boards/<BOARD>.overlay} file in the \texttt{zephyr} folder, for the current board
  \item Using a \texttt{<BOARD>.overlay} file in the \texttt{zephyr} folder.
\end{itemize}

\textbf{Warning:} PlatformIO board names may differ from Zephyr targets, which means that to help the build system automatically pick up \texttt{.overlay} file, the \texttt{<BOARD>} name in \texttt{<BOARD>.overlay} file must have the same name as specified in the official Zephyr board list.

\section*{Embedding files at compile time}

In case your \texttt{CMakeLists.txt} relies on using \texttt{generate_inc_*} functions that are used for generating and compressing individual files (for example certificates for secure connections) you need to configure your PlatformIO project accordingly using the following structure:
Where `apps-cert.der` and `apps-key.der` are the files you want to embed to your project at the compile time.

**Zephyr modules**

**Note:** PlatformIO automatically installs several default modules used with Zephyr framework including modules that implement silicon vendor Hardware Abstraction Layers (HALs).

Zephyr modules are externally maintained packages that allow using well-established and mature code created by third party developers.

These modules contain either a single `module.yml` file or `CMakeLists.txt` and `Kconfig` files that describe how to build and configure them. You can specify paths to additional directories with source code, `Kconfig`, etc. using `ZEPHYR_EXTRA_MODULES` at the top of your project's `CMakeLists.txt` file, for example:

```cmake
# Additional modules
set(ZEPHYR_EXTRA_MODULES "path/to-zephyr-custom-module" [...])

# Boilerplate code, which pulls in the Zephyr build system.
cmake_minimum_required(VERSION 3.13.1)
include($ENV{ZEPHYR_BASE}/cmake/app/boilerplate.cmake NO_POLICY_SCOPE)
project(my_zephyr_app)

# Add your source file to the "app" target. This must come after
# the boilerplate code, which defines the target.
target_sources(app PRIVATE ../src/main.c)
```

Since the build may not work correctly if the full path to sources is greater than 250 characters (see `CMAKE_OBJECT_PATH_MAX`) it might be a good idea to keep modules close to the project configuration files (e.g. in `zephyr` folder) in form of a git submodule.

**Warning:** Make sure the `ZEPHYR_EXTRA_MODULES` variable is set before including the boilerplate file, as shown above.

**Limitations**

At the moment several limitations are present:

- The minimum supported version of Python is 3.4
- No whitespace characters allowed in project paths.
- OpenThread module is not supported
Debugging

Debugging - “1-click” solution for debugging with a zero configuration.

- **Tools & Debug Probes**
  - On-Board Debug Tools
  - External Debug Tools

**Tools & Debug Probes**

Supported debugging tools are listed in “Debug” column. For more detailed information, please scroll table by horizontal. You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions.

**On-Board Debug Tools**

Boards listed below have on-board debug probe and ARE READY for debugging! You do not need to use/buy external debug probe.

#### Examples

- Zephyr RTOS for Atmel SAM
- Zephyr RTOS for CHIPS Alliance
- Zephyr RTOS for Freescale Kinetis
- Zephyr RTOS for Nordic nRF51
- Zephyr RTOS for Nordic nRF52
- Zephyr RTOS for NXP i.MX RT
- Zephyr RTOS for NXP LPC
- Zephyr RTOS for SiFive
- Zephyr RTOS for Silicon Labs EFM32
- Zephyr RTOS for ST STM32
## Platforms

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atmel SAM</td>
<td>Atmel</td>
</tr>
<tr>
<td>CHIPS Alliance</td>
<td>The CHIPS Alliance develops high-quality, open source hardware designs relevant to silicon devices and FPGAs.</td>
</tr>
<tr>
<td>Freescale Kinetis</td>
<td>Freescale Kinetis Microcontrollers is family of multiple hardware- and software-compatible ARM Cortex-M0+, Cortex-M4 and Cortex-M7-based MCU series. Kinetis MCUs offer exceptional low-power performance, scalability and feature integration.</td>
</tr>
<tr>
<td>Nordic nRF51</td>
<td>The Nordic nRF51 Series is a family of highly flexible, multi-protocol, system-on-chip (SoC) devices for ultra-low power wireless applications. nRF51 Series devices support a range of protocol stacks including Bluetooth Smart (previously called Bluetooth low energy), ANT and proprietary 2.4GHz protocols such as Gazell.</td>
</tr>
<tr>
<td>Nordic nRF52</td>
<td>The nRF52 Series are built for speed to carry out increasingly complex tasks in the shortest possible time and return to sleep, conserving precious battery power. They have a Cortex-M4F processor and are the most capable Bluetooth Smart SoCs on the market.</td>
</tr>
<tr>
<td>NXP i.MX RT</td>
<td>The i.MX RT series of crossover processors features the Arm Cortex-M core, real-time functionality and MCU usability at a cost-effective price.</td>
</tr>
<tr>
<td>NXP LPC</td>
<td>The NXP LPC is a family of 32-bit microcontroller integrated circuits by NXP Semiconductors. The LPC chips are grouped into related series that are based around the same 32-bit ARM processor core, such as the Cortex-M4F, Cortex-M3, Cortex-M0+, or Cortex-M0. Internally, each microcontroller consists of the processor core, static RAM memory, flash memory, debugging interface, and various peripherals.</td>
</tr>
<tr>
<td>SiFive</td>
<td>SiFive brings the power of open source and software automation to the semiconductor industry, making it possible to develop new hardware faster and more affordably than ever before.</td>
</tr>
<tr>
<td>Silicon Labs EFM32</td>
<td>Silicon Labs EFM32 Gecko 32-bit microcontroller (MCU) family includes devices that offer flash memory configurations up to 256 kB, 32 kB of RAM and CPU speeds up to 48 MHz. Based on the powerful ARM Cortex-M core, the Gecko family features innovative low energy techniques, short wake-up time from energy saving modes and a wide selection of peripherals, making it ideal for battery operated applications and other systems requiring high performance and low-energy consumption.</td>
</tr>
<tr>
<td>ST STM32</td>
<td>The STM32 family of 32-bit Flash MCUs based on the ARM Cortex-M processor is designed to offer new degrees of freedom to MCU users. It offers a 32-bit product range that combines very high performance, real-time capabilities, digital signal processing, and low-power, low-voltage operation, while maintaining full integration and ease of development.</td>
</tr>
</tbody>
</table>

## Boards

Note:

- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
- For more detailed board information please scroll the tables below by horizontally.

1.12 Boards

Rapid Embedded Development, Continuous and IDE integration in a few steps with PlatformIO thanks to built-in project generator for the most popular embedded boards and IDE.

Note:

- You can list pre-configured boards by `pio boards` command or PlatformIO Boards Explorer
- For more detailed board information please scroll tables below by horizontal.

### 1.12.1 Aceinna IMU

#### Aceinna Low Cost RTK

**Contents**

- Aceinna Low Cost RTK
  - Hardware
  - Configuration
  - Uploading
  - Debugging

**Hardware**

Platform **Aceinna IMU**: Open-source, embedded development platform for Aceinna IMU hardware. Run custom algorithms and navigation code on Aceinna IMU/INS hardware.

<table>
<thead>
<tr>
<th>Microcontroller</th>
<th>STM32F469NIH6</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>
<td>180MHz</td>
</tr>
<tr>
<td>Flash</td>
<td>1MB</td>
</tr>
<tr>
<td>RAM</td>
<td>384KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Aceinna</td>
</tr>
</tbody>
</table>

**Configuration**

Please use LowCostRTK ID for `board` option in “`platformio.ini`” (Project Configuration File):

```
[env:LowCostRTK]
platform = aceinna_imu
board = LowCostRTK
```

You can override default Aceinna Low Cost RTK settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `LowCostRTK.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.
**Uploading**

Aceinna Low Cost RTK supports the next uploading protocols:

- blackmagic
- jlink
- stlink

Default protocol is `stlink`.

You can change upload protocol using `upload_protocol` option:

```ini
[env:LowCostRTK]
platform = aceinna_imu
board = LowCostRTK
upload_protocol = stlink
```

**Debugging**

Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using `debug_tool` option in “platformio.ini” (Project Configuration File).

Aceinna Low Cost RTK has on-board debug probe and IS READY for debugging. You don’t need to use/buy external debug probe.

<table>
<thead>
<tr>

<td>Yes</td>
</tr>
</tbody>
</table>

**Aceinna OpenIMU 300**
Hardware

Platform Aceinna IMU: Open-source, embedded development platform for Aceinna IMU hardware. Run custom algorithms and navigation code on Aceinna IMU/INS hardware.

<table>
<thead>
<tr>
<th>Microcontroller</th>
<th>STM32F405RG</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frequency</td>

</tr>
<tr>
<td>Flash</td>
<td>1MB</td>
</tr>
<tr>
<td>RAM</td>
<td>128KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Aceinna</td>
</tr>
</tbody>
</table>

Configuration

Please use OpenIMU300 ID for board option in “platformio.ini” (Project Configuration File):

```ini
[env:OpenIMU300]
platform = aceinna_imu
board = OpenIMU300
```

You can override default Aceinna OpenIMU 300 settings per build environment using board_*** option, where *** is a JSON object path from board manifest OpenIMU300.json. For example, board_build.mcu, board_build.f_cpu, etc.

```ini
[env:OpenIMU300]
platform = aceinna_imu
board = OpenIMU300

; change microcontroller
board_build.mcu = stm32f405rg

; change MCU frequency
board_build.f_cpu = 120000000L
```

Uploading

Aceinna OpenIMU 300 supports the next uploading protocols:

- blackmagic
- jlink
- stlink
Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:OpenIMU300]
platform = aceinna imu
board = OpenIMU300
upload_protocol = stlink
```

**Debugging**

`Debugging` - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging `Tools & Debug Probes` using `debug_tool` option in “platformio.ini” (Project Configuration File).

Aceinna OpenIMU 300 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

<table>
<thead>
<tr>
<th>Compatible Tools</th>
<th>On-board</th>

### Configuration

Please use OpenIMU300ZA ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:OpenIMU300ZA]
platform = aceinna_imu
board = OpenIMU300ZA
```

You can override default Aceinna OpenIMU 300ZA settings per build environment using `board_***` option, where *** is a JSON object path from board manifest OpenIMU300ZA.json. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:OpenIMU300ZA]
platform = aceinna_imu
board = OpenIMU300ZA

; change microcontroller
board_build.mcu = stm32f405rg

; change MCU frequency
board_build.f_cpu = 120000000L
```

### Uploading

Aceinna OpenIMU 300ZA supports the next uploading protocols:

- blackmagic
- jlink
- stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```ini
[env:OpenIMU300ZA]
platform = aceinna_imu
board = OpenIMU300ZA

upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Aceinna OpenIMU 300ZA does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

<table>

</table>

**Configuration**

Please use OpenIMU330 ID for board option in “platformio.ini” (Project Configuration File):

```
[env:OpenIMU330]
platform = aceinna_imu
board = OpenIMU330
```

You can override default Aceinna OpenIMU 330 settings per build environment using board_*** option, where *** is a JSON object path from board manifest OpenIMU330.json. For example, board_build.mcu, board_build.f_cpu, etc.
Uploading

Aceinna OpenIMU 330 supports the next uploading protocols:

- blackmagic
- jlink
- stlink

Default protocol is stlink

You can change upload protocol using `upload_protocol` option:

```
[env:OpenIMU330]
platform = aceinna_imu
board = OpenIMU330
upload_protocol = stlink
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Aceinna OpenIMU 330 does not have on-board debug probe and **IS NOT READY** for debugging. You will need to use/buy one of external probe listed below.

Configuration

Please use OpenRTK ID for **board** option in “platformio.ini” (Project Configuration File):

```ini
[env:OpenRTK]
platform = aceinna_imu
board = OpenRTK
```

You can override default Aceinna OpenIMU 330ZA settings per build environment using **board_*** option, where *** is a JSON object path from board manifest `OpenRTK.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:OpenRTK]
platform = aceinna_imu
board = OpenRTK

; change microcontroller
board_build.mcu = stm32f469IG

; change MCU frequency
board_build.f_cpu = 180000000L
```

Uploading

Aceinna OpenIMU 330ZA supports the next uploading protocols:

- blackmagic
- jlink
- stlink
Default protocol is **stlink**

You can change upload protocol using `upload_protocol` option:

```ini
[env:OpenRTK]
platform = aceinna_imu
board = OpenRTK
upload_protocol = stlink
```

## Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging **Tools & Debug Probes** using `debug_tool` option in “platformio.ini” (Project Configuration File).

### Aceinna OpenRTK330L

#### Contents

- *Aceinna OpenRTK330L*
  - Hardware
  - Configuration
  - Uploading
  - Debugging

#### Hardware

Platform *Aceinna IMU*: Open-source, embedded development platform for Aceinna IMU hardware. Run custom algorithms and navigation code on Aceinna IMU/INS hardware.
### Configuration

Please use OpenRTK330L ID for `board` option in “platformio.ini” (*Project Configuration File)*:

```ini
[env:OpenRTK330L]
platform = aceinna_imu
board = OpenRTK330L
```

You can override default Aceinna OpenRTK330L settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `OpenRTK330L.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:OpenRTK330L]
platform = aceinna_imu
board = OpenRTK330L

; change microcontroller
board_build.mcu = stm32f469IG

; change MCU frequency
board_build.f_cpu = 180000000L
```

### Uploading

Aceinna OpenRTK330L supports the next uploading protocols:

- blackmagic
- jlink
- stlink

Default protocol is `stlink`

You can change upload protocol using `upload_protocol` option:

```ini
[env:OpenRTK330L]
platform = aceinna_imu
board = OpenRTK330L

upload_protocol = stlink
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.
Warning: You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging Tools & Debug Probes using debug_tool option in “platformio.ini” (Project Configuration File).

Aceinna OpenRTK330L does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

</tbody>
</table>

Configuration

Please use ATmega1281 ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:ATmega1281]
platform = atmelavr
board = ATmega1281
```

You can override default ATmega1281 settings per build environment using `board_***` option, where *** is a JSON object path from board manifest `ATmega1281.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:ATmega1281]
platform = atmelavr
board = ATmega1281

; change microcontroller
board_build.mcu = atmega1281

; change MCU frequency
board_build.f_cpu = 16000000L
```

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

ATmega1281 has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

board = ATmega324A
```

You can override default ATmega324A settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `ATmega324A.json`. For example, `board_build.mcu, board_build.f_cpu`, etc.

```ini
[env:ATmega324A]
platform = atmelavr
board = ATmega324A

; change microcontroller
board_build.mcu = atmega324a

; change MCU frequency
board_build.f_cpu = 16000000L
```

### Debugging

* Debugging - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

ATmega324A has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

### Configuration

Please use `flora8` ID for `board` option in “platformio.ini” (Project Configuration File):

```
[env:flora8]
platform = atmelavr
board = flora8
```

You can override default Adafruit Flora settings per build environment using `board_***` option, where *** is a JSON object path from board manifest flora8.json. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```
[env:flora8]
platform = atmelavr
board = flora8

; change microcontroller
board_build.mcu = atmega32u4

; change MCU frequency
board_build.f_cpu = 8000000L
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in “platformio.ini” (Project Configuration File).

Adafruit Flora has on-board debug probe and **IS READY** for debugging. You don’t need to use/buy external debug probe.

Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using *debug_tool* option in “platformio.ini” (Project Configuration File).

Controllino Mini has on-board debug probe and is ready for debugging. You don’t need to use/buy external debug probe.

### Configuration

Please use `digispark-pro` ID for `board` option in “platformio.ini” (Project Configuration File):

```ini
[env:digispark-pro]
platform = atmelavr
board = digispark-pro
```

You can override default Digispark Pro settings per build environment using `board_***` option, where `***` is a JSON object path from board manifest `digispark-pro.json`. For example, `board_build.mcu`, `board_build.f_cpu`, etc.

```ini
[env:digispark-pro]
platform = atmelavr
board = digispark-pro

; change microcontroller
board_build.mcu = attiny167

; change MCU frequency
board_build.f_cpu = 16000000L
```

### Debugging

*Debugging* currently does not support Digispark Pro board.

</tr>
</tbody>
</table>

Configuration

Please use ATTiny417 ID for board option in “platformio.ini” *(Project Configuration File)*:

```
[env:ATTiny417]
platform = atmelmegaavr
board = ATTiny417
```

You can override default ATTiny417 settings per build environment using board_*** option, where *** is a JSON object path from board manifest ATTiny417.json. For example, board_build.mcu, board_build.f_cpu, etc.

```
[env:ATTiny417]
platform = atmelmegaavr
board = ATTiny417

; change microcontroller
board_build.mcu = attiny417

; change MCU frequency
board_build.f_cpu = 16000000L
```

Debugging

*Debugging* currently does not support ATTiny417 board.

</tr>
<tr>
<td>Flash</td>
<td>256KB</td>
</tr>
<tr>
<td>RAM</td>
<td>32KB</td>
</tr>
<tr>
<td>Vendor</td>
<td>Adafruit</td>
</tr>
</tbody>
</table>

Configuration

Please use adafruit_blm_badge ID for board option in “platformio.ini” (Project Configuration File):

```
[env:adafruit_blm_badge]
platform = atmel|sam
board = adafruit_blm_badge
```

You can override default Adafruit BLM Badge settings per build environment using board_*** option, where *** is a JSON object path from board manifest adafruit_blm_badge.json. For example, board_build.mcu, board_build.f_cpu, etc.
Adafruit BLM Badge supports the next uploading protocols:

- `atmel-ice`
- `blackmagic`
- `jlink`
- `sam-ba`

Default protocol is `sam-ba`

You can change upload protocol using `upload_protocol` option:

```ini
[env:adafruit_blm_badge]
platform = atmelsam
board = adafruit_blm_badge
upload_protocol = sam-ba
```

### Debugging

*Debugging* - “1-click” solution for debugging with a zero configuration.

**Warning:** You will need to install debug tool drivers depending on your system. Please click on compatible debug tool below for the further instructions and configuration information.

You can switch between debugging *Tools & Debug Probes* using `debug_tool` option in *platformio.ini* (Project Configuration File).

Adafruit BLM Badge does not have on-board debug probe and IS NOT READY for debugging. You will need to use/buy one of external probe listed below.

<table>
